## REPORT

ON THE

## METEOROLOGY OF INDIA IN 1886.

## INTRODUCTION.

THE present is the twelfth Annual Report issued by the Indian Meteorological Department and the second of the second decade. It deals with nearly the same area as the Report of last year. The annexation of Upper Burma enabled the Department to commence work in an area which forms an integral portion of that part of Southern Asia which is subject to the influence of the north-east and south-west monsoons. An observatory was opened at Mandalay on the 1st November 1886, and contributes a series of observations for the year. An observatory was also opened at the commencement of the year at the Cocos Islands, nearly midway between the Andamans and Point Negrais in South-West Pegu. The observations at that station will tend to increase our knowledge of the meteorology of the Bay, and assist in elucidating the conditions which prevail in the centre of the Bay and near the Andamans antecedent to the formation of cyclones. Observations have been taken for several years at Calicut on the Malabar coast and at the hill station of Mussooree in the North-Western Provinces, but they are included for the first time in the Annual Report. The former observatory was established in connection with the storm signal service for warning the Bombay coast. The observatory at Mussooree is in connection with the Great Trigonometrical Survey Office, which is located there during the hot weather and rains, and the observations are taken with great accuracy, and are hence of much value.

The Report for the year 1886 is published in the form adopted by Mr. Blanford. The elements of meteorological observation for the year are discussed in the following order:—

- (1) Solar radiation and duration of bright sunshine.
- (2) Nocturnal radiation and temperature of the ground.
- (3) Temperature of the air.
- (4) Atmospheric pressure.
- (5) Wind direction and movement.
- (6) Hygrometry.
- (7) Cloud proportion.
- (8) Rainfall.

and are followed by a brief discussion on the more important features and abnormal variations of the year.

00135375

The following table gives a list of the number and distribution of the observatories which contributed registers during the year 1886 :—

| Provinces or Countries.                    | Stations in 1886. |
|--------------------------------------------|-------------------|
| Arabia . . . . .                           | 1                 |
| Persia . . . . .                           | 1                 |
| Lakhadives . . . . .                       | 1                 |
| Beluchistan . . . . .                      | 1                 |
| Kashmir . . . . .                          | 1                 |
| Punjab . . . . .                           | 13                |
| North-Western Provinces and Oudh . . . . . | 16                |
| Nepal . . . . .                            | 1                 |
| Assam . . . . .                            | 5                 |
| Bengal . . . . .                           | 19                |
| Central Provinces . . . . .                | 11                |
| Berars . . . . .                           | 5                 |
| Central India . . . . .                    | 4                 |
| Rajputana . . . . .                        | 6                 |
| Bombay . . . . .                           | 14                |
| Madras, Mysore and Coorg . . . . .         | 20                |
| Ceylon . . . . .                           | 8                 |
| Burma . . . . .                            | 9                 |
| Bay Islands . . . . .                      | 3                 |
| <b>TOTAL</b>                               | <b>139</b>        |

### DESCRIPTION OF THE STATIONS.

The Report for 1885 gives a very full and complete description of each of the stations at which observatories were then established, and it is hence unnecessary to repeat it in the present volume. The following gives brief descriptions of the stations which contribute registers for the first time to the Annual Report :—

*Mussooree*.—Situatd in latitude  $30^{\circ} 27' 30''$  N. and longitude  $78^{\circ} 6' 30''$  E. The observatory stands on the crest of a Himalayan peak, at an elevation above sea-level of 6,881 feet. Mussobree forms practically one station with Landour, where there is a convalescent depôt for European troops, the elevation of which is 7,459 feet. The observatory is situated in the Survey of India Office Compound.

*Calicut*.—A town and port in the Calicut taluk, Malabar district, Madras Presidency. It is situated on the sea coast 6 miles north of Beypur in the midst of extensive palm groves, in latitude  $11^{\circ} 15'$  N. and longitude  $75^{\circ} 49'$  E. The north end of the town is the old Portuguese quarter, while the southern portion contains the timber depôt and the Mahomedan quarter, above which lie the sea customs and salt offices, the light-house, and mercantile houses, facing the sea. Round the Mánánchira tank, a fine reservoir of fresh water, are grouped the chief public offices and many important buildings. The suburbs consist of detached villages surrounded with groves of palm, mango, and jack. The soil is sandy, and the deficiency of artificial drainage is not injuriously felt. The climate is healthy. The observatory is situated at the port office.

*Mandalay*.—The capital city in Upper Burma, is situated in latitude  $21^{\circ} 59'$  N. and longitude  $96^{\circ} 8'$  E., about two miles from the left bank of the Irrawaddy, in a level plain, at the foot of an isolated hill 600 feet in height, from which the city takes its name. The city of Mandalay may be said to consist of two parts, mural and extra-mural. The city proper

is laid out in a square, each side of which is a little over a mile in length, and is enclosed by a brick wall 26 feet high and 3 feet thick. The streets inside the city are very wide, and run parallel to the walls, dividing the building sites into rectangular blocks. In the suburbs the roads are laid out with something of the same regularity as in the city, but they are, with the exception of the principal road, of less width.

The climate is said to be healthy, the greatest heat being felt in April and May, before the setting in of the periodical rains. The transitions of the seasons are sudden, and earthquakes are not infrequent.

The observatory is located for the present at the civil hospital, but its permanent site has not yet been definitely settled.

*Cocos Islands.*—The Cocos Islands are two islands in the Bay of Bengal, situated between latitude  $14^{\circ} 4'$  and  $14^{\circ} 10' N.$  and in longitude  $93^{\circ} 21' E.$ , 45 miles north of the Great Andaman, and a short distance south of Table Island, on which there is a good light-house, showing a fixed light visible 22 miles in clear weather, and having an elevation of 195 feet above sea-level. The larger and more northerly of the two, called the Great Coco, is a low oblong-shaped island, between 6 and 7 miles in length and 2 miles broad. The smaller island, or Little Coco, lying about 3 leagues to the south-west of the Great Coco, is  $2\frac{1}{2}$  miles long and about a mile broad. Both islands are to a great extent protected by the Andamans from the heavy south-west swell of the Bay of Bengal; but more or less boisterous weather prevails in October and May, when the north-east and south-west monsoons set in. The Great Coco is surrounded by a strip of white coral beach, on which grows an almost continuous fence of cocoanut trees. A ship may anchor at any time of the year on the east side of the Great Coco in from 14 to 20 fathoms, and also on the west side in the north-east monsoon. Viewed from a distance, the island appears to be entirely covered with these palms (to which it doubtless owes its name), but in reality they form only a narrow belt, the interior being covered with forest trees. One or two parallel ridges, running north and south through the centre of the island, rise to a height not exceeding 50 feet. The island appears (from a careful examination made in 1874) to be destitute of drinking water, although it has been said that a good tank exists somewhere. The observatory is situated in Table Island in connection with the light-house.

Table I, on the following pages, gives the latitude and longitude of each station to the nearest minute of arc, and the elevation of the barometer, which, with very few exceptions, has been determined by spirit-levelling, either to datum levels fixed by the spirit-levelling operations of the Survey of India, or to the levels of the railway lines.

At the two following stations, the barometer has been removed to a level different from that which it occupied previously, and the change of elevation must, therefore, be allowed for in comparing the barometric registers of 1886 with those given in previous reports:—

| Stations.         | Former elevation. | Present elevation. | Date of change.   |
|-------------------|-------------------|--------------------|-------------------|
| Allahabad . . . . | 306.68 feet       | 309.28 feet        | 1st January 1886. |
| Mangalore . . . . | 52.03.            | 25.60              | 1st October 1886. |

A correction of 8 feet should be made to the elevation of the Poona barometer (1992.4 feet) from 1876 to 1878, as given in the Reports for those years.

TABLE I.—*Latitudes, Longitudes, and Elevations of the Meteorological Observatories.*

| PROVINCES.                | STATIONS.         | Latitude, north. | Longitude, east. | Elevation in feet above mean sea-level. | Level determined.               | How determined.                                                            | Authority for elevation.                              |
|---------------------------|-------------------|------------------|------------------|-----------------------------------------|---------------------------------|----------------------------------------------------------------------------|-------------------------------------------------------|

# METEOROLOGY OF 1886.

The meteorology of the year is described under the following heads:—

|                                     |                       |
|-------------------------------------|-----------------------|
| TEMPERATURE OF SOLAR RADIATION.     | ATMOSPHERIC PRESSURE. |
| DURATION OF BRIGHT SUNSHINE.        | ANEMOMETRY.           |
| TEMPERATURE OF NOCTURNAL RADIATION. | HYGROMETRY.           |
| TEMPERATURE OF THE GROUND.          | CLOUD PROPORTION.     |
| TEMPERATURE OF THE AIR.             | RAINFALL.             |

## SUMMARY.

The average distribution of temperature and pressure, and the mean resultant wind directions in each month, are shewn on the Charts II to IV.

The tables, giving an abstract of the observations of all stations, form the Appendix. The full registers of the six stations, Calcutta, Lucknow, Lahore, Nagpur, Bombay, and Madras, which in the first four annual reports formed a second Appendix, are now published in a separate form.

## SOLAR RADIATION.

The solar radiation thermometer employed at Indian stations<sup>1</sup> is a self-registering mercurial thermometer, having the bulb and half-an-inch of the stem coated with lamp-black, and enclosed in a large tube, from which the greater part of the air is exhausted. Excepting at one or two of the Madras stations and Dehra, all the instruments in use during the past year have been compared, directly or indirectly, with an arbitrary standard instrument of the same construction (Casella No. 9174), by thirty readings or more, taken when the instruments compared and the standard were exposed under similar conditions to the sun's rays; and the mean difference of the readings thus ascertained has been applied as a correction to all recorded readings of the former. In some cases, this correction amounts to as much as 15° or 20°, and no registers are regarded as comparable which have not been subjected to this precautionary correction.

The temperature shewn by these instruments being that of equilibrium, when the heat received in each second from the sun and from surrounding objects is exactly equal to that radiated away in the same interval to the sky and objects around, in order that the excess of this temperature above that of the atmosphere may be taken as a measure of the solar effect, it is obvious that surrounding objects and their distance from the instrument must remain unchanged. Hence the readings, even of one and the same sun thermometer, are not comparable *inter se*, if the place of its exposure has been changed. The considerable and constant differences shewn between the maximum recorded temperatures of different stations are probably in part due to unavoidable differences in the circumstances of the exposure. In order to minimize the effect of small unavoidable variations in the character of the ground immediately below the instrument, stands, 4 feet

<sup>1</sup> Any exceptions are noted in the tables.

high, have been provided at all stations established within the last ten years, and also at the majority of the older stations. At one or two only of the latter, it has been deemed of more importance to preserve uniformity with the practice of former years than to introduce this improvement. The use of the stands is, in all cases, noticed in the tables. It is to be observed that at some of the stations the stand has been fixed rather deeper in the ground than at others, so that the height of the instrument is not uniformly 4 feet, as was intended; but the difference is generally not more than a few inches.

The air temperature, which is deducted from that of the solar thermometer, in order to obtain the excess due to radiation, is that shewn by the maximum shaded thermometer. The residue is somewhat less than the actual effect of the sun's rays, since the maximum air temperature is produced an hour or two later than the maximum solar effect; but, on an average, the error arising from this source may be regarded as uniform; and, in any case, the most accurate observation can be only a relative measure of the solar effect.

The above precautions, if strictly observed, should give observations that are fairly comparable with each other at one and the same station; but, in some instances, it has been found that the substitution of a new thermometer for one that has been injured or accidentally destroyed has been followed by such a change in the average value of the readings, as to induce a suspicion that some uneliminated error affects the readings of the substituted instrument. In order, therefore, to distinguish those registers that are not open to any suspicion of this kind, lists have been given in the reports for the six previous years of all the changes, both of the instruments employed and of their position or mode of exposure, that have been made in the eleven years 1875—85, as far as the necessary information exists in the Office.

The following is a similar list for the year 1886:—

*Dates of any change of the instruments used for registering solar temperature or of the circumstances locally affecting them.*

| Stations.           | Date of change.         | REMARKS.                     |
|---------------------|-------------------------|------------------------------|
| Mooltan . . . . .   | 15th January 1886 . . . | New thermometer substituted. |
| Ditto . . . . .     | 27th March „ . . .      | Ditto.                       |
| Murree . . . . .    | 3rd May „ . . .         | Ditto.                       |
| Sialkot . . . . .   | 5th April „ . . .       | Ditto.                       |
| Ditto . . . . .     | 1st July „ . . .        | Ditto.                       |
| Lahore . . . . .    | 20th January „ . . .    | Ditto.                       |
| Ludhiana . . . . .  | 6th June „ . . .        | Ditto.                       |
| Sirsa . . . . .     | 14th August „ . . .     | Ditto.                       |
| Bareilly . . . . .  | 11th February „ . . .   | Ditto.                       |
| Ditto . . . . .     | 30th July „ . . .       | Ditto.                       |
| Agra . . . . .      | 14th July „ . . .       | Ditto.                       |
| Lucknow . . . . .   | 10th June „ . . .       | Ditto.                       |
| Ditto . . . . .     | 13th August „ . . .     | Ditto.                       |
| Allahabad . . . . . | 1st January „ . . .     | Site of observatory changed. |

*Dates of any change of the instruments used for registering solar temperature or of the circumstances locally affecting them—continued.*

| Stations.             | Date of change.          | REMARKS.                           |
|-----------------------|--------------------------|------------------------------------|
| Dhubri . . . . .      | 11th November 1886 . . . | New thermometer substituted.       |

| Bangalore . . . . .   | 6th December „ . . .     | Instruments removed to a new shed. |
| Akyab . . . . .       | 4th July „ . . .         | New thermometer substituted.       |
| Ditto . . . . .       | 8th December „ . . .     | Ditto.                             |
| Mergui . . . . .      | 23rd August „ . . .      | Site of observatory changed.       |

Table I [Appendix] gives abstracts of the registers of 109 stations, *viz.*, the means of all readings, the highest and lowest readings in each month, the mean excess of the sun thermometer readings above those of the maximum thermometer in shade, and the greatest and the least differences. The solar radiation observations of an unusually large number of stations for 1886 have been rejected, in consequence of the very large discrepancies which they shewed. These were in some cases evidently due to carelessness on the part of the observer, and at others apparently to slight defects in the instruments, which gradually increased in amount with time. Several of the abstracts are also very imperfect. This is mainly due to breakage of the instruments. They are very fragile, and are especially liable to destruction from storms, hail, and other causes, and it usually takes some time before they are replaced. Of the data given in Table I, the mean of all the readings and their mean excess both depend mainly on the frequency and quantity of cloud and haze.

These temperatures afford a rough criterion of the average intensity of insolation at the earth's surface. The mean temperature, being partly dependent on that of the air, shews a regular annual variation. The mean excess temperature presents an annual variation of, in general, much smaller range, and of a different character, and varying, more or less, at different stations. Its chief feature is that the maximum intensity of solar radiation occurs, as a rule, some time in the winter half of the year (October to March), when the sun is in southern declination, and the thickness of the absorbing atmosphere traversed by the sun's rays is a maximum, while its minimum falls about midsummer (in May, June, or July). This apparently anomalous result is, doubtless, in part due to the fact that, over a large part of India, the atmosphere is most cloudy in the summer and autumn months, but not entirely so; for if, instead of taking the mean excess of insolation temperature on all days of the month, we select those on which, at 10 A.M. and 4 P.M., the sky is free from visible clouds, or on which the average cloud proportion does not exceed one-fifth of the sky expanse, an annual variation, almost identical in character, and not always even of smaller range, still presents itself. Illustrations of this fact were given in the Report for 1880.

Table II, below, gives the average monthly excess temperature of the sun-thermometer, derived from the registers of three years and upwards, except in a few cases, in which the substitution of a new instrument has been followed by such a change in the average value of the readings as to render the present readings not comparable with the previous. It has been assumed in other cases that variations in the instruments used at different times are approximately eliminated by the correction of their readings to a common standard, in the manner noticed in the first paragraph of this section.

Table III gives the differences of the mean excess insolation temperatures in each month of 1886, from the corresponding values in Table II. Some of these seem of doubtful value, although all have been struck out that, on the grounds of internal evidence, could be inferred to be probably inaccurate.

TABLE II.—Average Excess of Insolation over the corresponding Maximum Shade Temperatures.

| Mergui . . .       | —1·6     | —0·7      | —0·4   | —0·8   | +0·2 | +2·2  | +0·7  | +0·5    | —0·8       | —0·3     | —2·0      | +1·5      | —0·5  |
| Port Blair . . .   | —1·9     | +0·5      | +1·8   | +4·3   | +6·6 | +3·3  | +7·5  | +4·4    | +3·7       | +1·2     | —7·1      | —1·9      | +1·9  |
| Nancowry . . .     | +5·2     | +4·6      | +4·2   | +4·5   | +2·5 | 0     | +3·9  | 0       | +0·8       | +0·3     | +2·0      | +2·4      | +2·5  |

The comparison table shews some local variations of interest depending apparently upon local atmospheric conditions. The following are the chief:—

1st—A deficiency in and near the North-West Himalayas as shewn by the Leh, Rawalpindi, Delhi, Chakrata and Roorkee solar thermometer observations. The deficiency for the year averaged from 2° to 3°.

2nd—A very considerable deficiency over a large portion of Central India and Rajputana, as represented by the stations of Sutna, Jeypore, Sambhar, Bickaneer, Ajmere, Mount Abu and Pachpadra. The deficiency varied from  $\frac{1}{2}$ ° to 7° in this area.

3rd—A considerable deficiency over the greater portion of Southern India to the south of latitude 16° N. This deficiency is shewn by Belgaum, Karwar, Mangalore, Bangalore, Salem, Cochin, and Wellington, and was greatest at Cochin, where it averaged 6·9° for the year.

4th—A slight excess at the Bay Islands and in Southern Burma.

5th—A deficiency at all the Behar and Bengal stations, excepting Calcutta, but not large in amount except at Purneah (4·5°), Dacca (3·6°), and Chittagong (2·2°).

Taking the sum of the figures in each monthly column of Table III with the exclusion of the first two stations and dividing by the number of stations furnishing averages for each month (varying from 79 to 90), the following variations for each month of 1886 are obtained:—

| January. | February. | March. | April. | May. | June. | July. | August. | September. | October. | November. | December. |
|----------|-----------|--------|--------|------|-------|-------|---------|------------|----------|-----------|-----------|
| —1·3     | —0·9      | —0·9   | —1·2   | —1·2 | —0·8  | —1·4  | —1·5    | —1·1       | —0·9     | —1·8      | —1·2      |

The results, it will be seen, are consistent, and may apparently be accepted as trustworthy. They shew that in every month of the year the mean equilibrium temperature of insolation throughout India was below the average of the past ten or eleven years by amounts varying from  $0.8^{\circ}$  to  $1.8^{\circ}$  and averaging  $1.2^{\circ}$  for the year. The deficiency, although large, accompanied very considerable irregularity, and the most carefully conducted observatories of Calcutta, Allahabad, and Bombay shew variations of opposite character. The variations at these stations are given in the following table :—

| Stations.   | January. | February. | March. | April. | May. | June. | July. | August. | September. | October. | November. | December. | Year. |
|-------------|----------|-----------|--------|--------|------|-------|-------|---------|------------|----------|-----------|-----------|-------|
| Calcutta .  | —0.8     | —1.0      | —1.5   | —1.7   | +0.4 | +2.0  | +2.9  | +2.8    | +1.2       | +2.0     | —1.2      | —1.2      | +0.3  |
| Allahabad . | 0        | —0.7      | 0      | +1.5   | +2.1 | +0.4  | +0.1  | —6.3    | +2.6       | +3.4     | +3.9      | +0.7      | +0.6  |
| Bombay .    | +0.4     | +0.9      | +0.5   | +0.5   | +2.0 | —0.2  | +0.2  | +3.9    | +1.5       | +1.0     | —0.5      | +1.0      | +0.9  |

The annual variations for the past seven years shew a fairly well-marked periodicity. The following are the annual mean anomalies for the period 1880 to 1886 :—

1880 +0.4° 1881 —0.3° 1882 —0.6° 1883 —1.0° 1884 —1.7° 1885 —1.1° 1886 —1.2°

The figures suggest a periodic change coinciding roughly with the sun-spot period, but it is impossible from the figures or from observations taken with this instrument to determine whether the variations are due (1st) to absolute changes in the solar radiation ; (2nd) to variations in the average amount of aqueous vapour, cloud, dust, &c., in the atmosphere which either absorbs or scatters the solar radiation in its passage through the atmospheres and hence slightly affect, the amount which reaches and acts at the earth's surface ; or (3rd) to slight differences in the amount of moisture contained in the adjacent ground, which influences and modifies the amount of radiation received by the bulb of the thermometer from the earth's surface, and therefore the resultant or equilibrium temperatures. I should be inclined to consider the causes as given above to be that of the order of their importance, and also to infer that the yearly anomalies do suggest a slight variation in the sun's radiating power.

## DURATION OF BRIGHT SUNSHINE.

The registration of the *duration of bright sunshine* is effected by means of the sunshine recorder, an instrument originally devised and first employed by Mr. Campbell of Islay, subsequently modified in such a manner as to furnish a trace capable of ready measurement, and finally improved to its present form by Professor G. Stokes and Mr. Whipple. It consists of a spherical glass lens, mounted on a brass support, which also carries a curved brass plate fixed beneath the sphere, of such curvature, and at such distance from the spherical surface, that the focal point, in which the sun's rays converge, travels across the surface of the plate between sunrise and sunset. A slip of card, with

printed divisions, corresponding to the hours, is inserted in grooves in the brass plate, and as the radiant focus moves along the card, it burns a line, which is either continuous or interrupted, according to the state of the sky; and the measurement of which is a record of the time during which the sun shone with sufficient intensity to burn the surface of the card.

The instrument has hitherto been employed only at Allahabad, Calcutta, Jeypore, Lahore, Dehra, and Bombay. It promises to be a most valuable adjunct to the sun-thermometer, and perhaps even more important than that instrument; since the duration of sunshine is a more direct measure of the amount of solar heat reaching the earth's surface than the register of its mean maximum intensity. The traces are measured to tenths of an hour, but in summing the daily totals for each month, residual decimals are omitted, and in Table II (Appendix) the totals are given to integral hours only.\*

The Table II Appendix gives the data of five recording stations for each month of 1886; and those of Bombay for four months only. In the first column the sums of the measured traces is given; in the second that of the total number of hours that the sun is above the horizon; and in the third, the ratio of the first to the second in the form of a percentage. Table IV (below) gives the averages of the registers at Calcutta, Jeypore, Dehra, and Allahabad; and Table V a comparison of the monthly totals of 1886 with the averages of Table IV.

TABLE IV.—Average monthly Total Duration of Bright Sunshine.

| STATIONS.              |                                                          | Year. | January. | February. | March. | April. | May. | June. | July. | August. | September. | October. | November. | December. | Year. |

TABLE V.—Comparison of monthly Total Duration of Bright Sunshine in 1886, with the averages of Table IV.

| STATIONS.                    | January. | February. | March. | April. | May. | June. | July. | August. | September. | October. | November. | December. | Year. |
|------------------------------|----------|-----------|--------|--------|------|-------|-------|---------|------------|----------|-----------|-----------|-------|
| Calcutta (Alipore) . . . . . | + 4      | +28       | -19    | +10    | 0    | -26   | 0     | 0       | -37        | -14      | -3        | +12       | -4    |
| Allahabad . . . . .          | +11      | +16       | -21    | +17    | +21  | +24   | -9    | -4      | -11        | -54      | -3        | +5        | -1    |
| Jeypore . . . . .            | ?        | +17       | -6     | +14    | +1   | -1    | -28   | +8      | +21        | +6       | +10       | +8        | ?     |
| Dehra . . . . .              | -15      | -16       | -45    | +3     | -25  | +4    | -21   | -13     | +17        | -11      | -5        | -13       | -12   |

As compared with the mean of the preceding years 1883 to 1886, the proportion of sunshine at Calcutta was above the average in January, February, April, and December. It was considerably in defect in March, June, September, and October. On the mean of the year, the sun shone brightly during 60 per cent. of the day hours in 1886 as compared with the average 61 per cent. for the past four years. At Allahabad the proportion of sunshine was above the average in January, February, April, May, and June, and was considerably below it in March, and also in October, which was an unusually cloudy month in Behar and the eastern districts of the North-Western Provinces. The average proportion of sunshine in October 1886 was only 60 as compared with the normal, 76 per cent. On the mean of the year the percentage of sunshine was 69, or 1 per cent. below the average of the previous four years. At Dehra the proportion of sunshine was slightly above the normal average in April, June, and September, and was below it in all other months. On the mean of the year the percentage of the sunshine was 46, or 3 per cent. below the average of the previous years.

The records for Jeypore are not quite complete. The amount of sunshine was above the average in the months of February, April, August, September, October, November, and December and below it in March and July. The average of the 11 months, February to December, was 68 as compared with the normal, 67.

In order to ascertain in what measure the total duration of sunshine varies with the average of its maximum daily intensity, the monthly means of the excess sun thermometer readings for the same four years are given, and also the differences of 1886 at Calcutta, Jeypore, and Allahabad, in the following Table (VI).

TABLE VI.—Average Excess of Insolation Temperatures and their differences of 1886.

| STATIONS. |                  | January. | February. | March. | April. | May. | June. | July. | August. | September. | October. | November. | December. | Year. |

## NOCTURNAL RADIATION.

The tables of nocturnal radiation comprise the registers of 108 stations. Of these, however, not less than 22 are imperfect, owing, in the majority of cases, to the destruction of the instruments, either in this or the preceding year, and to the stock being insufficient to replace them without loss of time. The province the registers of which are most defective is Madras, where four stations send defective or untrustworthy registers. Those with the most complete registers are the Central Provinces and Bengal—each with only two defective registers.

Table III (Appendix) shews the mean temperature registered by the exposed minimum thermometer (corrected for instrument errors), and the highest and lowest temperatures in each month, together with the dates on which they occurred, and also the depression of the first below the mean temperature of the minimum shaded thermometer, about 4 feet from the ground, and the greatest and least depression. At most stations in Northern India, the thermometers, which are spirit thermometers generally with spherical bulbs, about half an inch in diameter, but in some cases with cylindrical bulbs  $\frac{1}{4}$  inch diameter, are laid on a thick pad of common country blanket. Thus a tolerably uniform radiating surface is secured, which would not be the case were the usual practice followed, *viz.*, that of placing the instrument on grass, or the bare ground.

The present method has been followed only during the last nine or ten years, and it has not been deemed desirable to include in the computation of average values the results obtained under the previous varied conditions of exposure. Table VII, which follows, gives, therefore, the averages of past years only in so far as the radiation temperatures are those registered under uniform conditions. Table VIII gives the differences of the mean monthly depression for each station in 1886 and the corresponding averages of Table VII.

TABLE VII.—*Average Depression of monthly Mean Nocturnal Radiation Temperatures below Mean Minimum Shade Temperatures.*

Some of the figures in the preceding table appear to be untrustworthy, more especially those of any station the algebraical sign of which is constant through the year, or the mean annual anomaly of which differs considerably from those of adjacent stations.

There are variations common to several neighbouring stations which evidently represent one phase of the local abnormal features of the year. Amongst these may be noticed—

*1st*—A large negative variation at Bareilly, Agra and Lucknow, representing of course a smaller difference between the minimum in shade and the terrestrial radiation thermometer than usual, and hence less radiation at night from the earth's surface.

*2nd*—A small negative variation in the case of all the Burma stations, indicating diminished radiation at night in that area.

The following table gives the algebraical means of all the quantities in each column of Table VIII, month by month, and hence the mean monthly anomalies of the whole Indian area :—

|                          | January. | February. | March. | April. | May. | June. | July. | August. | September. | October. | November. | December. |
|--------------------------|----------|-----------|--------|--------|------|-------|-------|---------|------------|----------|-----------|-----------|
| Number of stations . . . | 82       | 81        | 81     | 84     | 83   | 85    | 84    | 87      | 85         | 86       | 87        | 86        |
| Mean . . .               | -0.5     | +0.1      | -0.4   | +0.8   | -0.3 | -0.2  | -0.4  | -0.3    | +0.2       | -1.1     | -0.3      | +0.1      |

The comparison table shews in the first place that the mean anomalies were small for all months except October, when there was a large negative anomaly (1.1°), and April, for which there was a largish positive anomaly (0.8°). The anomalies were positive for four months, *viz.*, February, April, September, and December, and negative for the remaining eight months. The mean anomaly of the year was -0.2°. Considering the unreliable character of some of the observations, it is doubtful whether this anomaly can be accepted as indicating a real decrease in the amount of the nocturnal radiation and therefore, a slightly less diathermanous condition of the atmosphere than usual,

## TEMPERATURE OF THE GROUND.

Observations of the temperature of the ground have been recorded during the whole of the year at the five stations, Calcutta, Allahabad, Dehra, Lahore, and Jeypore.

The thermometers used for the purpose are verified standard mercurial thermometers, with attached scales of porcelain, the scale being engraved also on the tube. At Alipore (Calcutta), with the exception of the thermometer at 6 feet and at Allahabad, with the exception of the thermometer at 9 feet, they are read three times daily, at equal intervals of eight hours; at Lahore, with the exception of the thermometer at 6 feet, and Jeypore, with the exception of the thermometers at 10 and 20 feet, they are read four times daily, at intervals of six hours; and at Dehra once daily, *viz.*, at 3 P.M.

The thermometers below the surface have the bulb protected with a pointed copper shoe, which rests on the ground at the bottom of a wooden tube, inserted to the specified depth, and projecting 6 inches above the surface, the upper end being closed by a cap of metal or wood. Those at depths of 3 and 6 feet are attached to the lower end of a stout wooden bar of about half the diameter of the tube. Those at one foot have a brass ring attached to the top of the wooden frame of the thermometer, by which it is lifted; and in all these, the lower part of the frame around the bulb has been cut away, and the lower end fitted with the copper shoe above mentioned.

Table IV (Appendix) gives the monthly means of the readings at the hours of observation and those of the day, in 1886. In the case of Dehra, only the former are available.

At Alipore (Calcutta), two thermometers are used for obtaining the temperature at one foot deep. The object of this was explained in the Report for 1882.<sup>1</sup> The instrument (here designated the old thermometer), which has been in use since April 1880, is inserted in a wooden tube, about 2 inches wider than the slip of wood to which the thermometer is attached. The mean temperature of the year, shewn by this instrument, is lower than either that of the surface thermometer or that at 3 feet deep, and it was found that the means, as computed from its observations, correctly represented the true diurnal means. It was, therefore, inferred that the anomaly might probably be due to the nocturnal convection of the cold air within the tube, and a consequent reduction of the temperature of the thermometer bulb below that of the ground or that depth. To test this view, and also to obtain a more trustworthy register, a second thermometer, here called the new thermometer, was installed at a few inches distance from the former, similarly mounted, but in a tube of such dimensions that the wooden mounting, with a strip of cloth around it above the bulb, loosely fits the section of the tube, and all convection is thus prevented. A comparison of three complete years' registers of the two thermometers has entirely confirmed the original surmise. While the afternoon ( $13\frac{3}{4}$ h.) temperatures, shewn by the new thermometer, are either the same as those of the old thermometer or slightly lower, the early morning ( $5\frac{3}{4}$ h.) and late evening ( $21\frac{3}{4}$ h.) readings are almost invariably higher; and especially so in the cold season and in clear weather, when the nocturnal radiation is greatest. In some months, this difference exceeds  $1^{\circ}$ ; and the mean of the day, on the average of three years, as shewn by the new thermometer, is  $0.2^{\circ}$  higher than that of the

<sup>1</sup> Report on the Meteorology of India in 1882, page 26.

old thermometer, and is in excess of the mean surface temperature by  $0.3^{\circ}$ , being  $1^{\circ}$  lower than that of the thermometer at 3 feet deep.

From the registers of the surface, 1 foot (new) and 3 feet thermometers at Alipore, it appears, as in previous years, that, not only is the temperature of the ground surface, on an average,  $3.2^{\circ}$  higher than that of the air, but there is a further rapid increase downwards, amounting on an average to  $1.4^{\circ}$  in 3 feet. This, as has been pointed out in previous reports, can only be attributed to the existence of an abnormal source of heat at some moderate depth below the ground surface. And there is no difficulty in indicating such, in the decomposing organic matter with which certain beds in the alluvium are highly charged. At a depth of about 40 feet beneath Calcutta, for example, is a bed of quicksand of a dark colour and strong fetid smell, which is distinctly warm to the touch.

The Allahabad ground temperatures also shew a slight downward decrease ( $0.1^{\circ}$ ), on the average of nearly seven years. At Jeypore, the surface temperature of the five years for which we have a complete register, is  $3.4^{\circ}$  higher than that at 3 feet deep, and not less than  $5.9^{\circ}$  higher than that of the air.

The averages of past years, and the monthly departures from them in 1886, at the four stations, are given in the following Tables IX and X:—

TABLE IX.—Average Monthly Mean Temperatures of the Ground and of the Air.

|                    |               | Years. | January. | February. | March. | April. | May.  | June. | July. | August. | September. | October. | November. | December. | Year. |

## TEMPERATURE OF THE AIR.

At the large majority of stations,<sup>1</sup> the temperature of the air is observed only at 10 A.M. and 4 P.M., and these readings, together with those of the maximum and minimum self-registering thermometers, afford the data for the deduction of the mean temperature. At some stations in the Madras Presidency, readings are also recorded at

<sup>1</sup> At Dehra, in the North-Western Provinces, the observations are recorded at 9h. 30m. and 15h. 30m., instead of 10h. and 16h.

10 P.M. ; at Lahore, Chamba, Jeypore, Allahabad, Saugor Island, and Vizagapatam, 4 A.M. and 10 P.M. are additional hours ; and at Calcutta (Alipore), Bombay, and Leh 6 A.M. and 10 P.M.

At stations in India and Burma generally, the instruments are suspended in a cage, consisting of a narrow frame, with wire net-work at front and back, which is affixed to one of the uprights supporting the ridge-pole of a thatched shed, open all round, at such a height that the bulbs of the several thermometers range from 4 feet to 4 feet 6 inches above the ground level. The shed and cage, of the approved form, are depicted in Part I of the Indian Meteorologist's *Vade Mecum* ; and although it appears that, at some stations, this pattern is not strictly adhered to, the variations in general are not great. At Simla, Lucknow, Roorkee, Dehra, Saugor, Seoni, Jubbulpore, Akola, Amraoti and Kurrachee, the sheds are smaller, and more or less enclosed by lattice-work or louvres, but the readings of the instruments are apparently not much affected thereby.

With the exception of those at Vizagapatam, all the thermometers for air-temperatures at stations other than of Ceylon have been verified either at Calcutta, Bombay, or Madras. The verification at the freezing points was made by immersion in crushed melting ice, and at higher temperatures, comprehending the whole range of observation, by comparison with Kew standard thermometers. All the readings are corrected to their true values.

The thermometers in use in Ceylon have been verified at Colombo, at various temperatures, by comparison with a standard thermometer, tested at the Greenwich observatory.

Table V (Appendix) gives the monthly and annual means and extreme temperatures at 140 observatories (four more than in 1885). Three stations, *viz.*, Dehra, Calcutta, and Lahore, furnish duplicate registers ; so that the number of stations represented is 137. The registers of Calicut on the Malabar Coast, Mandalay in Upper Burma, and Cocos or Table Island north of the Andamans, appear in the present report for the first time. Owing to various causes, the following are more or less incomplete :—

|             |             |                 |
|-------------|-------------|-----------------|
| Amini Divi. | Rajkot.     | Mandalay.       |
| Mussooree.  | Hambantota. | Diamond Island. |
| Sironcha.   | Kandy.      | Cocos Island.   |

The tabulated data are the means of each hour of observation, those of the maximum and minimum temperatures respectively, the extreme temperatures of each month and year, the mean daily and the extreme monthly and annual ranges, and the mean temperatures of each month of the year, which have been computed in the following manner :—

- (a) At Calcutta (Alipore), they are the means of the hourly measurements of the thermograph traces.
- (b) At Leh, the means of the observations at 6h., 10h., 16h., and 22h., without further correction.
- (c) At Bombay the means of the measurements of the thermograph traces, at 6h., 10h., 14h., 16h., and 22h., with additive corrections, derived from the Colaba hourly observations in past years.
- (d) At Lahore, Chamba, Allahabad, Jeypore, Vizagapatam, and Saugor Island, the means of the four sets of readings at 4h., 10h., 16h., and 22h., without further correction.

- (e) At stations in the Punjab (excepting Lahore), the Central Provinces and Berar, and also at Dehra (Forest School), Ghazipur, Dhubri, Tezpur, Tura, Demagiri, False Point, Port Blair, Nancowry, Katmandu, Quetta, Bushire, Pedong, Aden, the Burmese stations (excepting Akyab), stations in Rajputana (excepting Ajmere, Sambhar, and Jeypore), in Central India and Bombay (excepting those specified in (c) and (h)), and at Gopalpur, Calicut, Mangalore, and Mercara, they are the means of the 16-hour readings and the minimum temperatures.
- (f) At the Madras stations, including Bangalore and Secunderabad, but not Vizagapatam, Gopalpur, Mangalore, Mercara, Rajahmundry, Kurnool, Cuddapah, Coimbatore, Madura, and Amini Divi, the means of the 10h., 16h., and 22h., and minimum observations, corrected by range factors, derived from the Madras registers in past years. At Kurnool, Cuddapah, Coimbatore, Madura, Amini Divi, Masulipatam, and Rajahmundry, the means of the 10h., 16h., and minimum observations only, similarly corrected.
- (g) At the stations in Bengal and Assam (excepting those named in a, d and e), in the North-Western Provinces (except at Allahabad, Ghazipur, and Dehra Forest School), at Ajmere, Sambhar, and Akyab, the means of the 10h., and 16h. and minimum observations, corrected by range factors, derived from the six-hourly observations at the same or neighbouring stations in past years. In the case of Dehra, the Roorkee factors have been used, and in that of Sibsagar, the Goalpara factors. The Monghyr factors are employed for Purneah, the Patna factors for Durbhunga, and those of Calcutta for Berhampore, Jessore, and Burdwan. In the case of Pithoragarh, the Ranikhet range factors have been used, and in that of Sambhar, the Ajmere factors.
- (h) At Deesa, Kurrachee, Poona, and Belgaum, they are the means of the observations, with additive or subtractive corrections, derived from the hourly observations of past years.
- (i) At Mongpoo (Bengal) and the Ceylon stations, they are those of the maximum and minimum temperatures.

Table VI, in the Appendix, gives the data from which the isotherms of each month, in Plates II to IV, have been drawn. These are the adopted sea-level equivalents of the mean monthly temperatures in Table V (omitting hill stations). The reduction to sea-level values has been made, by adding  $1^{\circ}$  temperature for every 450 feet of elevation.

Table XI, below, gives the average temperatures of all the stations, the records of which afford data for three years and upwards, derived from the registers of past years, by the same methods as are employed to obtain the means of Table V (Appendix I); and Table XII shews the variations, in 1886, above or below these averages. Table XIII is a geographical summary of the data of Table XII.

In a very carefully worked out discussion of the temperature registers of North-Western India, published in Part II of the second volume of the *Indian Meteorological Memoirs*, Mr. S. A. Hill has determined what are probably more accurate average monthly and annual temperatures for a number of the stations here included, than those adopted in Table XI. And he has further given range factors, by the use of which the crude means of the same stations in Table V (Appendix) may be corrected to values of the same order. As, however, the differences of the values in Mr. Hill's table and those here given are, in most cases, very small, and as, after all, the former can be considered only as a closer approximation to an unknown true mean, it has been considered better to adhere to the methods hitherto followed, and so preserve the continuity of the records. The temperatures of 60 stations, extracted from Mr. Hill's table, were given in the report for 1882 (p. 39).

TABLE XI.—Average monthly mean temperatures of 132 stations in India, Ceylon, &amp;c.

| STATIONS.        | Years. | January. | February. | March. | April. | May. | June. | July. | August. | September. | October. | November. | December. | Year. |
|------------------|--------|----------|-----------|--------|--------|------|-------|-------|---------|------------|----------|-----------|-----------|-------|
| Aden . . .       | 4—7    | 75.2     | 76.0      | 78.4   | 81.9   | 84.8 | 86.7  | 85.3  | 84.9    | 86.1       | 81.9     | 77.4      | 75.6      | 81.2  |
| Mauritius . .    | 15—16  | 78.9     | 78.8      | 78.0   | 76.6   | 73.1 | 70.3  | 68.7  | 69.0    | 70.1       | 72.2     | 75.0      | 77.7      | 74.0  |
| Bushire . . .    | 9—10   | 57.4     | 57.6      | 62.7   | 71.4   | 80.9 | 84.5  | 88.1  | 88.7    | 85.0       | 77.7     | 69.0      | 61.1      | 73.7  |

*January.*—The mean temperature of the month of January differed very little from the average. This was almost entirely due to the fact that the variations were compensatory, alternations of warm and cool weather succeeding each other, and slightly higher temperature in Southern India accompanying diminished temperature in Northern India. The snowfall reports that were received during the early part of the year indicate that the snowfall in the hill districts of Afghanistan, bordering on the Indus, was heavier than usual, and the snow line was below its normal height at the end of the month. To the east and north-east of the Punjab the snowfall of January appears not to have been excessive, and the month was open and mild in Lahoul and Kulu. The total amount of the snowfall in those districts was considerably less than the fall in January 1885.

The more important cool periods which accompanied, and followed snowfall and stormy weather in the hills and in Upper India, were the 4th and 5th, the 14th, the 18th, 19th, 20th and 21st, the 23rd and 24th, and the 30th and 31st. The third of these periods, *viz.*, from the 18th to the 21st, was the period of most widely spread stormy weather and of most extensive snowfall, more especially in Afghanistan.

*February.*—February was an unusually dry month over the whole of Northern India. There were two periods during the month when the skies clouded over in Northern India, and light showers fell in Upper India. The first began on the 30th of January and lasted

until the 2nd of February, and the second from the 15th to the 17th of the month. A large amount of snow fell during these two stormy periods in the hills to the west, north, and east of the Punjab. A very rapid fall of the barometer preceded the snow-storms of the first period, and this was followed by an equally rapid rise, and by the passage of a cold wave from west to east across Northern India. The lowest temperatures of the cold weather, and of the year over the whole of India, were observed during the week after the storm.

The transmission of the cold wave is shown very completely by the following statement.

The lowest temperature of the year at each of the following stations was observed on the 2nd at—

|                     |       |                     |       |

The preceding shows clearly the transmission of what is most easily described as a wave of cold. The greatest cold of the year was experienced on the 2nd in Sind and Guzerat, on the 3rd in the Punjab hill districts, the North Punjab, and Central India, on the 4th in the South Punjab, North-Western Provinces, Rajputana, and Central Prov-

inces as far east as Agra and Sutna. On the 5th, the cold wave had passed east as far as Darjeeling, Hazaribagh, and Burdwan, and gave the lowest temperatures of the year; on the 6th it had advanced to the eastern districts of Bengal and Assam, and on the 7th into Arakan and North Burma. Although these cold waves are of occasional occurrence during the cold weather in Northern India, their conditions have not yet been fully investigated. The following are a few of the chief features of the present one:—

- (a) It followed the occurrence of a deep depression and a cold weather storm with heavy rain or snowfall in Upper India and the adjoining hill districts, and accompanied the passage of a wave or state of high pressure across the continent from west to east.
- (b) It commenced along the north-west frontier of India in Sind and the Indus valley, and hence in the neighbourhood of the area of heaviest snowfall, and advanced much more rapidly (at an average rate of about 300 miles per diem) than the surface winds, but at a rate not greater probably than the winds at a moderate elevation above the earth's surface (*vis.*, 12 miles per hour) across the whole extent of Northern India.
- (c) It accompanied or produced great dryness of the air during its passage. The following table gives a few examples:—

| STATIONS.            | HUMIDITY AT 10 A. M. |                    |                                                                  |
|----------------------|----------------------|--------------------|------------------------------------------------------------------|

The greatest dryness as measured by the humidity at 10 A.M. occurred in the majority of cases on the day before or after the night of the minimum temperature, as might have been expected.

- (d) It accompanied the prevalence of moderately strong westerly and north-westerly winds down the Gangetic plain and their extension across Chutia Nagpur into Bengal and Orissa, and the displacement of the feeble and moderately damp local sea winds which prevailed in South Bengal at the commencement of February. Exactly similar changes, but even more marked in amount, followed heavy snowfall in the hills to the north of Sikkim and Assam in January 1887, with the single exception that the actions and effects commenced in North Bengal and Assam and travelled southwards.

The only explanation appears to be that after stormy weather and snowfall in the hills a body of cool dry air descends from the hills and modifies the weather to a very marked extent

for some days afterwards in the adjacent plain districts. The descending air is excessively dry, and hence favours rapid radiation at night and produces very cool nights. Also the stormy weather gives rise to two opposite effects in the hills and the plain districts during its prevalence. The snow covering given to the hills during the stormy weather reduces the temperature of the air to, or slightly below,  $32^{\circ}$  at and above a comparatively low level, whilst the indraught to the area of low pressure and disturbance in the adjacent plains accompanies the extension of damp sea winds westwards over the plains of Northern India, and hence gives rise to temperature considerably in excess of that normal to the season. Hence the air descending from the hills after the storm has ceased, although warmed by the action of descent, arrives over the plains cooler than the damp air which it displaces. These intervals characterized by low day as well as night temperature, great dryness, and clearness of the atmosphere form the pleasantest periods of the cold weather, more especially in Bengal. The very great change in the temperature relations between the hill and plains during and after the stormy periods is very marked, and is sufficiently shown by the following data for the storm which preceded the cold wave period of February 1886:—

| Difference of level<br>in feet. | Stations.          | 10 A. M. temperature on the days stated.                        |

The above is a brief statement of the more important effects of some, if not all, of the larger cold weather storms of Upper India. The problem of their generation, their more important features, and more striking after-effects on the meteorology of Northern India, are of great interest, and I hope to deal with them in a paper for the Meteorological Memoirs.

The mean temperature of the month was, chiefly in consequence of the unusually cold period during the early part of the month, considerably below the average in the Punjab, North-Western Provinces, Behar, Bengal, Central India, Rajputana and the northern districts of the Central Provinces. The deficiency was greatest in the Punjab, where it averaged  $1^{\circ}7'$ . It was  $1^{\circ}3'$  in the Gangetic plain and Bengal and  $1^{\circ}$  in Rajputana and Sind. It was actually greatest at Murree, where it was  $4^{\circ}2'$ , Rawalpindi ( $3^{\circ}1'$ ), Lahore ( $2^{\circ}7'$ ), and Jacobabad ( $2^{\circ}6'$ ). The deficiency diminished in amount slowly eastwards and more rapidly southwards. The deficient temperature in Northern India was accompanied in Southern India by the opposite anomaly of excessive temperature. This inverse relation between the temperature anomalies of Northern India and Southern India, or of tropical

and extra-tropical India, appears to be the usual relation, as is shown by the following comparison of the past five years, except when there is a very large deficiency in the temperature of Northern India, in which case the same feature usually extends to Southern India :—

| YEAR. |                        | January. | February. | March. | November. | December. |
|-------|------------------------|----------|-----------|--------|-----------|-----------|
| 1886  | Northern India . . . . | —0·1°    | —0·9°     | —0·8°  | +1·7°     | +1·8°     |
|       | Southern India . . . . | —0·2°    | +0·1°     | +0·5°  | —0·1°     | —0·3°     |
| 1885  | Northern India . . . . | +0·3°    | —2·7°     | +0·2°  | +0·9°     | —0·1°     |
|       | Southern India . . . . | —0·1°    | —0·5°     | —0·4°  | +0·2°     | +0·3°     |
| 1884  | Northern India . . . . | +0·2°    | —0·9°     | +0·9°  | —0·8°     | —0·9°     |
|       | Southern India . . . . | —1·7°    | —1·6°     | —0·5°  | —1·1°     | —1·2°     |
| 1883  | Northern India . . . . | +0·1°    | —1·5°     | —1·0°  | —1·7°     | —2·9°     |
|       | Southern India . . . . | —0·4°    | —0·3°     | —0·5°  | —1·4°     | —1·9°     |
| 1882  | Northern India . . . . | +2·0°    | —0·9°     | +1·7°  | —0·5°     | +1·9°     |
|       | Southern India . . . . | +0·3°    | 0         | +0·4°  | —0·3°     | —0·5°     |

The excess in Southern India was comparatively small, and did not exceed  $\frac{1}{2}^{\circ}$  at the great majority of stations.

*March.*—The variations of temperature from the normal were slightly greater in March than in February. The mean temperature of the month was generally below the average for the Punjab, Rajputana, North-Western Provinces, Bengal, Central Provinces, Central India, the Berars, North Deccan, and Sind, or over the whole of Northern and Central India. The deficiency was most marked at the hill stations, more especially at Ranikhet, for which it was  $3\cdot9^{\circ}$ , and Murree where it was  $3\cdot5^{\circ}$ . The average deficiency of temperature was  $1\cdot9^{\circ}$  at the hill stations of Upper India, and in South Behar and Chutia Nagpur,  $1\cdot3^{\circ}$  in the Punjab and Sind,  $1\cdot1^{\circ}$  in Lower Bengal, and less than  $1^{\circ}$  in the North-Western Provinces, Central Provinces, Central India, and North Deccan. From the snowfall reports received it would appear that the snowfall in the North-West Himalayas during the first half of March was either below the average or normal in amount. During the last fortnight the weather was very rough, with much snow. This seems to have been the chief cause in reducing the temperature of the month below the mean in Upper India and at the hill stations. The local low temperature in Behar was mainly due to unusually heavy rainfall in that area on the 9th and 10th, which cooled the air for some time afterwards.

Temperature was slightly above the normal in Southern India. The excess in Ceylon averaged  $0\cdot9^{\circ}$ , in the Bay Islands  $0\cdot8^{\circ}$ , and on the Malabar Coast  $1\cdot1^{\circ}$ . This is another illustration of the opposition between the smaller temperature variations in Northern and Southern India.

*April.*—The meteorological conditions were approximately normal during the month of April. Temperature increased slightly more rapidly than usual in Northern and Central India, and the local variations for the month were the same in general character, but less in amount than during March. The mean temperature of the month was slightly below the average in the Gangetic plain, the Nerbudda valley, Behar, Bengal, Orissa, and Chutia Nagpur. The defect nowhere exceeded  $1\frac{1}{2}^{\circ}$  and averaged  $\frac{1}{2}^{\circ}$  for Northern and

Central India. Temperature was in excess in Sind, Rajputana, and the whole of Western and Southern India. The variations in those districts were also generally small and were largest at Jacobabad ( $2^{\circ}$ ), Mount Abu ( $2^{\circ}$ ), Ajmere ( $1.9^{\circ}$ ), and Madura ( $1.7^{\circ}$ ). The variations were much more irregular in Northern than in Southern India.

The hottest portion of India during the first three weeks of the month was the Central Provinces, Berars, Behar, and the eastern districts of the North-West Provinces and, during the latter portion of the month, Central India, Rajputana, and Sind.

The following table gives the highest maximum temperatures of the month at all stations where it exceeded  $110^{\circ}$ , and the dates on which they were registered:—

| STATIONS.             | Maximum temperature. | Date.       |
|-----------------------|----------------------|-------------|
| Pachpadra . . . . .   | $114.0^{\circ}$      | 26th        |
| Hyderabad . . . . .   | $118.1^{\circ}$      | 26th        |
| Jacobabad . . . . .   | $114.4^{\circ}$      | 27th        |
| Khandwa . . . . .     | $112.2^{\circ}$      | 27th        |
| Akola . . . . .       | $112.1^{\circ}$      | 27th        |
| Amraoti . . . . .     | $111.4^{\circ}$      | 26th & 27th |
| Sironcha . . . . .    | $111.1^{\circ}$      | 20th        |
| Nagpur . . . . .      | $110.7^{\circ}$      | 26th        |
| Nowgong . . . . .     | $110.7^{\circ}$      | 25th & 28th |
| Jeypore . . . . .     | $110.7^{\circ}$      | 27th        |
| Hoshangabad . . . . . | $112.4^{\circ}$      | 27th        |
| Sambalpur . . . . .   | $110.3^{\circ}$      | 25th        |
| Chanda . . . . .      | $112.8^{\circ}$      | 25th        |
| Ludhiana . . . . .    | $113.4^{\circ}$      | 29th        |
| Sialkot . . . . .     | $110.5^{\circ}$      | 28th        |
| Delhi . . . . .       | $112.0^{\circ}$      | 28th        |
| Sirsa . . . . .       | $112.1^{\circ}$      | 27th        |
| Agra . . . . .        | $112.8^{\circ}$      | 28th        |
| Gorakhpur . . . . .   | $111.4^{\circ}$      | 22nd        |
| Jhansi . . . . .      | $111.0^{\circ}$      | 22nd        |
| Allahabad . . . . .   | $111.1^{\circ}$      | 24th        |
| Benares . . . . .     | $111.6^{\circ}$      | 23rd        |
| Gya . . . . .         | $111.0^{\circ}$      | 24th        |
| Deesa . . . . .       | $111.5^{\circ}$      | 25th        |

*May.*—The temperature variations of the month of May were considerably greater than those of the preceding months of the year. This was due to the occurrence of a much larger number of thunderstorms and duststorms in Bengal and the Gangetic plain, and the fall of a larger amount of rain than is usual in May. The mean temperature was below the average over nearly the whole of Northern India, and also in the

Deccan and Carnatic. The deficiency was greatest in South Behar and Chutia Nagpur, for which it was  $1.9^{\circ}$ . It exceeded  $1^{\circ}$  in the Gangetic plain ( $1.5^{\circ}$ ), in the hills of the North-Western Provinces ( $1.3^{\circ}$ ), and on the Carnatic Coast ( $1.2^{\circ}$ ), and averaged  $0.6^{\circ}$  in Bengal and the Deccan. The mean temperature of the month was slightly above the average in the Punjab, East Rajputana, Assam, and Western India. The only area in which there was a marked excess of temperature included Sind, West Rajputana, Cutch, and Guzerat. In that area the mean daily temperature was  $2.6^{\circ}$  above the normal. The excess was greatest at Pachpadra ( $3.9^{\circ}$ ), Jacobabad ( $3.7^{\circ}$ ), and Deesa ( $2.9^{\circ}$ ).

Temperature increased in the Central Provinces, the Deccan, and Central India until the 11th, 12th, 13th, or 14th of the month, when the highest temperatures of the year in those districts were registered. The following gives the more important maximum temperatures of the year at stations in those districts, with the dates on which they were registered :—

| STATIONS.          | Maximum temperature of the year. | Date on which it was registered. |
|--------------------|----------------------------------|----------------------------------|
| Nagpur . . . . .   | $114.2^{\circ}$                  | 13th.                            |
| Chanda . . . . .   | $113.7^{\circ}$                  | 11th.                            |
| Sironcha . . . . . | $113.3^{\circ}$                  | 11th.                            |
| Akola . . . . .    | $113.5^{\circ}$                  | 14th.                            |
| Sholapur . . . . . | $111.0^{\circ}$                  | 13th.                            |
| Kurnool . . . . .  | $111.5^{\circ}$                  | 13th.                            |

Temperature increased in the North-Western Provinces, Rajputana, Sind, Cutch, and Guzerat for another fortnight, and reached its maximum on the 25th, when the highest temperatures of the year were generally recorded in those districts. The following table gives the maximum temperature of the year at the more important stations in that area :—

| STATIONS.                 | Maximum temperature of the year. | Date of occurrence. |
|---------------------------|----------------------------------|---------------------|
| Pachpadra . . . . .       | $123.1^{\circ}$                  | May 25th.           |
| Jacobabad . . . . .       | $122.2^{\circ}$                  | "                   |
| Hyderabad . . . . .       | $121.0^{\circ}$                  | "                   |
| Deesa . . . . .           | $118.6^{\circ}$                  | 26th                |
| Bhuj and Rajkot . . . . . | $117.7^{\circ}$                  | "                   |
| Bickaneer . . . . .       | $117.2^{\circ}$                  | 25th                |
| Sirsa . . . . .           | $117.0^{\circ}$                  | "                   |
| Jeypore . . . . .         | $115.8^{\circ}$                  | "                   |
| Agra . . . . .            | $115.6^{\circ}$                  | "                   |
| Sambhar . . . . .         | $114.5^{\circ}$                  | 26th.               |
| Ajmere . . . . .          | $114.0^{\circ}$                  | 25th.               |

The first four stations in the list were those at which the absolutely highest temperature of the year were recorded, and the absolute maximum temperatures at each of these

stations were registered on the 25th or 26th of May and are those given in the list. These temperatures, it may be remarked, are not quite as high as have been observed in recent years. The highest temperatures recorded in India for each of the past twelve years are given below:—

| Year. | STATIONS.                  | Maximum temperature. | Month. |
|-------|----------------------------|----------------------|--------|
| 1875  | Dera Ismail Khan . . . . . | 125°0'               | June.  |
|       | Sialkot . . . . .          |                      |        |
| 1876  | Sialkot . . . . .          | 120°0'               | June.  |
| 1877  | Jacobabad . . . . .        | 118°9'               | June.  |
| 1878  | Agra . . . . .             | 120°3'               | June.  |
| 1879  | Jacobabad . . . . .        | 120°7'               | June.  |
| 1880  | Lahore . . . . .           | 119°5'               | June.  |
| 1881  | Pachpadra . . . . .        | 122°3'               | May.   |
| 1882  | Pachpadra . . . . .        | 119°5'               | May.   |
| 1883  | Dera Ismail Khan . . . . . | 121°5'               | June.  |
| 1884  | Jacobabad . . . . .        | 120°8'               | June.  |
| 1885  | Jacobabad . . . . .        | 116°9'               | July.  |
| 1886  | Pachpadra . . . . .        | 123°1'               | May.   |

This statement shows that the shade temperature registered at Pachpadra on the 25th May 1886 (123°1') is the highest that has been recorded since 1875, and that the highest shade temperature recorded in India since the establishment of the imperial system is 125° at Dera Ismail Khan and Sialkot in June 1875.

*June.*—The rains were somewhat later than usual in commencing on the Bengal and Bombay coasts. They were fully established on each between the 14th to the 18th, and extended with unusual quickness over the whole country. They produced a very rapid fall of temperature. The highest temperatures of the year in the Punjab were registered in Northern India just before the commencement of the first general burst of the monsoon on the 12th and 13th of the month. The following were the maximum temperatures of the year registered in the Punjab:—

| STATIONS.                  | Maximum temperature. | Date.      |
|----------------------------|----------------------|------------|
| Sialkot . . . . .          | 117°9'               | 13th June. |
| Dera Ismail Khan . . . . . | 117°5'               | Ditto.     |
| Ludhiana . . . . .         | 116°3'               | 12th June. |
| Lahore . . . . .           | 115°9'               | Ditto.     |
| Peshawar . . . . .         | 112°0'               | Ditto.     |

The mean temperature of the month was considerably below the average in Northern and Central India. The deficiency averaged 2°6' in the Nerbudda valley, 1°4' in the

Central Provinces, and slightly exceeded  $1^{\circ}$  in the Punjab, Central India and East Rajputana, Orissa, and the Carnatic. The variations of all other districts were small, and were negative except in Ceylon, the Malabar Coast, Sind, and Assam, where there was a slight excess of temperature. The variations were mainly dependent upon the occurrence of rainfall. Amongst the largest were the following :—

| STATIONS.           | Variation between actual mean and normal mean temperature of the month. |
|---------------------|-------------------------------------------------------------------------|
| Madras . . . . .    | $-3.3^{\circ}$                                                          |
| Meerut . . . . .    | $-3.3^{\circ}$                                                          |
| Sambalpur . . . . . | $-2.8^{\circ}$                                                          |
| Khandwa . . . . .   | $-2.8^{\circ}$                                                          |
| Nowgong . . . . .   | $-2.8^{\circ}$                                                          |
| Delhi . . . . .     | $-2.7^{\circ}$                                                          |
| Indore . . . . .    | $-2.7^{\circ}$                                                          |
| Agra . . . . .      | $-2.7^{\circ}$                                                          |
| Chanda . . . . .    | $-2.7^{\circ}$                                                          |

*July.*—The temperature of this as of the preceding month was generally somewhat below the average. It was in defect except in Sikkim, Orissa, Arakan, and Pegu, where the temperature was practically normal. The deficiency averaged  $1.1^{\circ}$  at the west coast stations of the Bay and  $1.0^{\circ}$  in Behar and Chutia Nagpur. The mean temperature of the whole of India for the month was  $0.4^{\circ}$  below the average. The largest variations were the following :—

| STATIONS.         | Variation between actual mean and normal mean temperature of the month. |
|-------------------|-------------------------------------------------------------------------|
| Madras . . . . .  | $-2.3^{\circ}$                                                          |
| Lahore . . . . .  | $-2.0^{\circ}$                                                          |
| Lucknow . . . . . | $-2.0^{\circ}$                                                          |
| Benares . . . . . | $-2.0^{\circ}$                                                          |
| Madura . . . . .  | $-2.0^{\circ}$                                                          |

*August.*—The temperature variations for the month of August were generally similar to those of the preceding month, but smaller in amount. The mean temperature of the month was slightly in excess in the Punjab, Orissa, Central Provinces, Tenasserim, and the Bay Islands. The increased temperature accompanied very deficient rainfall in the case of the Punjab and the Central Provinces, and the excess was greatest at Mooltan ( $2.0^{\circ}$ ) and Dera Ismail Khan ( $1.8^{\circ}$ ). Temperature was below the average in almost all other districts. The variations were very small except at the Coromandal coast stations, where the mean temperature of the month was from  $1.5^{\circ}$  to  $2.1^{\circ}$  below the average.

*September.*—The rains practically ceased at the commencement of the month in the Punjab, and in the second week of the month in the North-Western Provinces, and were abnormally light in the Central Provinces and Central India. They had been below the average during the month of August. Hence temperature increased rapidly over the larger portion of Northern and Central India, and the mean temperature of the month was above the average in the Punjab ( $2.4^{\circ}$ ), the Central Provinces ( $2.0^{\circ}$ ), the Nerbudda valley, the Deccan, and Mysore ( $1.4^{\circ}$ ) and in the North-West Himalayas ( $0.8^{\circ}$ ). At the following stations the mean temperature of the month was  $3^{\circ}$  or upwards above the normal temperature of the month:—

| STATIONS.                  | Difference between actual mean and normal mean temperature of the month. |
|----------------------------|--------------------------------------------------------------------------|
| Sirsa . . . . .            | $+3.4^{\circ}$                                                           |
| Lahore . . . . .           | $+3.1^{\circ}$                                                           |
| Dera Ismail Khan . . . . . | $+3.0^{\circ}$                                                           |
| Ludhiana . . . . .         | $+3.0^{\circ}$                                                           |
| Nagpur . . . . .           | $+3.0^{\circ}$                                                           |

Temperature was in defect in Bengal and Behar. The deficiency was most marked in Behar, and Chutia Nagpur, which area received excessive rain during the month. The defect at Purneah amounted to  $2^{\circ}$ , at Patna to  $1.6^{\circ}$ , at Burdwan and Durbhangā to  $1.3^{\circ}$ , and at Berhampore and Hazaribagh to  $1.2^{\circ}$ .

*October.*—The month of October was characterized by clear dry weather over the whole of Upper and Central India, by unusual tranquillity and absence of stormy weather in the Bay, and by moderately heavy rain in the Madras coast districts and in South Behar and Chutia Nagpur. The temperature hence rose above the average over nearly the whole of India, and the mean of the month for all India was  $1^{\circ}$  above the normal. The excess averaged  $2.4^{\circ}$  in West Rajputana and Sind,  $1.8^{\circ}$  in Assam and the North-West Himalayas,  $1.5^{\circ}$  in Bengal,  $1.4^{\circ}$  in the Central Provinces,  $1.2^{\circ}$  in Central India and Rajputana, and  $1^{\circ}$  in the Punjab and North-Western Provinces. The temperature was less than  $1^{\circ}$  above the normal in all other districts, except the Malabar Coast, the Deccan, Konkan, and Tenasserim, where it was normal. At the following stations the mean temperature of the month was more than  $3^{\circ}$  above the normal temperature of the month:—

| STATIONS.           | Difference between actual mean and normal mean temperature of the month. |
|---------------------|--------------------------------------------------------------------------|
| Ajmere . . . . .    | $+4.4^{\circ}$                                                           |
| Leh . . . . .       | $+3.8^{\circ}$                                                           |
| Kailang . . . . .   | $+3.5^{\circ}$                                                           |
| Pachpadra . . . . . | $+3.6^{\circ}$                                                           |
| Rajkot . . . . .    | $+4.0^{\circ}$                                                           |
| Deesa . . . . .     | $+3.2^{\circ}$                                                           |

*November.*—The early cessation of the rains in Upper and Central India continued to influence the temperature of India to a marked extent. Temperature was throughout the whole month very considerably above the average, and the mean temperature of the whole of India for the month was  $1.2^{\circ}$  in excess of the normal mean. Two cyclonic storms which formed near the Andamans, and advanced W. N. W. across the Bay into Southern India, modified the temperature conditions in the area they passed over or influenced, and the mean temperature of the month was hence very slightly below the average in the Bay Islands, Tenasserim, Arakan, Pegu, and the Coromandel and Malabar Coast districts. It was in excess in all other parts of India. The excess was greatest in Western Rajputana, Sind, and Guzerat, where it averaged  $2.8^{\circ}$ . It was  $2.3^{\circ}$  in the North-West Himalayas,  $2.2^{\circ}$  in the Central Provinces,  $2^{\circ}$  in Orissa,  $1.8^{\circ}$  in the Nerbudda valley,  $1.7^{\circ}$  in the Punjab and Central India,  $1.5^{\circ}$  in the North-Western Provinces and Bengal,  $1^{\circ}$  in the Deccan, and  $0.6^{\circ}$  in Assam. The greatest positive variations occurred at the following stations, which hence define the areas of greatest excess of temperature and of most abnormal temperature conditions during the month:—

| STATIONS. |   |   |   |   |   |   |   |   |   |   | Difference between actual mean and normal mean temperature of the month. |
|-----------|---|---|---|---|---|---|---|---|---|---|--------------------------------------------------------------------------|
| Kailang   | . | . | . | . | . | . | . | . | . | . | $+6.3^{\circ}$                                                           |
| Rajkot    | . | . | . | . | . | . | . | . | . | . | $+4.3^{\circ}$                                                           |
| Pachpadra | . | . | . | . | . | . | . | . | . | . | $+3.8^{\circ}$                                                           |
| Deesa     | . | . | . | . | . | . | . | . | . | . | $+3.2^{\circ}$                                                           |

*December.*—No large change of meteorological conditions occurred during the month. A small cyclone formed in the south-east of the Bay and advanced to the Madras coast, but its influence was very small. Hence the general characteristics of the meteorology of the period remain unchanged, and the average temperature of the month was considerably above the average over the whole of Northern and Central India, whilst it was slightly below it in the Deccan and Southern India. The variations were smaller than those of November, but the abnormal features of the temperature in Northern and Central India continued unaltered until the month of January 1887, when a series of cold weather storms, most influential and vigorous in North-Eastern India, reversed these abnormal features. The mean temperature of the month of December was  $1.7^{\circ}$  above the normal in Bengal, Behar, and the North-Western Provinces,  $1.5^{\circ}$  above it in the Punjab,  $1.2^{\circ}$  in Orissa,  $1.1^{\circ}$  in Assam and Sikkim,  $1^{\circ}$  in Central India, and  $0.5^{\circ}$  in the Central Provinces. The largest positive variations were those of Kailang ( $4.8^{\circ}$ ) and Leh ( $3.7^{\circ}$ ), and hence show that, as in the preceding month, the temperature variations were most excessive in the hill districts to the east of the Punjab.

The year 1886 was marked by smaller variations from the normal temperature than is frequently the case, and in this respect it contrasts with the preceding year 1885. During

the cold weather months of January, February, and March, the snowfall on the Himalayas was probably not greater than the average amount, and was considerably less than that of 1885. There was a well marked wave of cold transmitted from west to east during the first week of February, and it is by no means certain, although it is very probable, that it was associated directly with heavy snowfall in the hills to the west of the Punjab. The mean temperature of February was below the average over the whole of Northern India. There were unusually heavy falls of snow both in Afghanistan, Ladakh, and Tibet in March, but they influenced temperature on the whole less than the snowfall that occasioned the abnormal cold period in February.

There were no very marked features in the temperature of April and May. During the first three months of the rains, the temperature was slightly in defect. The early termination of the rains in Upper and Central India in the first and second week of September respectively, and quite a fortnight before the usual period, was followed by a very marked increase of temperature, which lasted until the end of the year. The excess of temperature increased in amount until the end of November, when the abnormal dryness of the air in Upper India began to cause a reduction of temperature below the average.

The temperature of India was in defect in February, March, June, July, and August by amounts averaging from  $0.3^{\circ}$  in August to  $0.6^{\circ}$  in February, and was normal in January, April, and May. It was in excess from September to the end of the year, the excess increasing from  $0.5^{\circ}$  in September to  $1.2^{\circ}$  in November and falling to  $0.5^{\circ}$  in December. The variations were almost completely compensating, and the mean temperature was in excess by a very small amount, less than one-tenth of a degree, and was hence practically normal.

The mean anomaly of each month as deduced from the temperature observations taken at all the Indian and Burmese stations enumerated in the foregoing tables, 119 to 126 in number in each month, was as follows:—

|                          | January.       | February.      | March.         | April.         | May.           | June.          | July.          | August.        | September.     | October.       | November.      | December.      | Year.           |
|--------------------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|-----------------|
| Number of stations . . . | 123            | 121            | 119            | 122            | 122            | 125            | 123            | 125            | 125            | 125            | 126            | 125            | 125             |
| Means . . . . .          | $-0.1^{\circ}$ | $-0.6^{\circ}$ | $-0.5^{\circ}$ | $+0.1^{\circ}$ | $-0.1^{\circ}$ | $-0.5^{\circ}$ | $-0.4^{\circ}$ | $-0.3^{\circ}$ | $+0.5^{\circ}$ | $+1.0^{\circ}$ | $+1.2^{\circ}$ | $+0.5^{\circ}$ | $+0.08^{\circ}$ |

The mean anomaly of the year was  $+0.08^{\circ}$ , and is in the opposite direction to the anomalies of the previous five years.

The progressive variation of the mean annual temperature during the last 12 years is shown in the following table:—

|                           | 1875.   | 1876.   | 1877.   | 1878.   | 1879.   | 1880.   | 1881.   | 1882.   | 1883.   | 1884.   | 1885.   | 1886.   |

| Number of stations . . .  | 72      | 72      | 74      | 74      | 70      | 106     | 110     | 113     | 122     | 122     | 118     | 122     |
| Mean anomaly . . . .      | $-0.29$ | $-0.08$ | $+0.17$ | $+0.62$ | $-0.13$ | $+0.13$ | $-0.01$ | $-0.11$ | $-0.48$ | $-0.61$ | $-0.29$ | $+0.08$ |
| Progressive variation . . | ...     | $+0.21$ | $+0.25$ | $+0.45$ | $-0.75$ | $+0.26$ | $-0.14$ | $-0.10$ | $-0.37$ | $-0.13$ | $+0.32$ | $+0.37$ |

## ATMOSPHERIC PRESSURE.

With the exceptions noted in the footnote<sup>1</sup> below, all the barometers, the registers of which are here given, are mercurial barometers on Fortin's principle; and, excepting those in Ceylon and some in Madras,<sup>2</sup> all have been carefully compared, either directly or indirectly, with the Calcutta standard. Those in Bombay, at Bickaneer, and Mount Abu in Rajputana, and Neemuch and Indore in Central India, and in Berar, have been compared by Mr. F. Chambers with the Bombay standard, which, according to a lengthened comparison with two verified barometers sent from Calcutta, reads  $\cdot 012$  inch lower than the old Calcutta standard. All the registers (except those of some of the Madras stations, which exceptions do not include those enumerated in the footnote below), have been corrected to the readings of the latter instrument. The Ceylon barometers have been verified at Colombo, by comparison with a standard tested by Messrs. Negretti and Zambra, who compare with the standard at Kew. A correction of  $+ \cdot 011$  inch has been applied to their registers, therefore, to bring them up to the values of the Calcutta standard.

Those of Madras, with the exceptions above noted, are corrected to the Madras observatory standard.

With a view to rendering the barometric data, published in previous reports, as far as possible trustworthy and comparable with those now and henceforth to be registered,

<sup>1</sup> Casella's observatory barometers on the Kew principle (*i.e.*, with a contracted scale to compensate changes of level in the cistern), were in use at the following stations:—

|            |                       |                      |               |
|------------|-----------------------|----------------------|---------------|
| Aden.      | Gya.                  | Ratnagiri (from 31st | Mercara.      |
| Bushire.   | Chittagong.           | March).              | Negapatam.    |
| Mooltan.   | Hoshangabad.          | Bhuj (from 19th Au-  | Akyab.        |
| Ludhiana.  | Seoni.                | gust.)               | Bassein.      |
| Sialkot.   | Saugor.               | Gopalpur.            | Toungoo.      |
| Lucknow.   | Nowgong.              | Rajahmundry.         | Thayetmyo.    |
| Gorakhpur. | Sambhar.              | Cuddapah.            | Cocos Island. |
| Jhansi.    | Pachpadra (up to 17th | Mangalore.           |               |
|            | April).               |                      |               |

At Bombay, Calcutta, Madras, and Rangoon, large Newman's standards, with adjustable scales and tubes of more than  $0\cdot 5''$  diameter.

Casella's small observatory standards on Fortin's principle, with tubes of  $0\cdot 4$  inch in diameter, were in use at the following stations:—

|                   |             |                     |                               |
|-------------------|-------------|---------------------|-------------------------------|
| Chamba (from 16th | Agra.       | Berhampore.         | Kurrachee.                    |
| November).        | Allahabad.  | Burdwan.            | Ratnagiri (up to 10th March). |
| Dera Ismail Khan. | Benares.    | Jessore.            | Musulipatam.                  |
| Peshawar.         | Sibsagar.   | Dacca.              | Bellary (from 1st Septem-     |
| Murree.           | Tezpur.     | Saugor Island.      | ber).                         |
| Rawalpindi (up to | Dhubri.     | Cuttack.            | Moulmein.                     |
| 16th April).      | Silchar.    | False Point.        | Diamond Island.               |
| Rawalpindi (from  | Darjeeling. | Nagpur.             | Mergui.                       |
| 12th September).  | Pedong.     | Buldana.            | Port Blair.                   |
| Lahore.           | Purneah.    | Sutna.              | Nancowry (up to 3rd Feb-      |
| Delhi.            | Durbhunga.  | Ajmere.             | ruary).                       |
| Meerut.           | Patna.      | Jacobabad (from 4th |                               |
| Bareilly.         | Hazaribagh. | May).               |                               |

At stations in the Central Provinces, Central India, Rajputana, and Bombay, other than those named above, portable mountain barometers on Fortin's principle, with tubes of about  $0\cdot 25$  inch diameter, are used.

<sup>2</sup> The instruments at the following Madras stations have been compared, either directly or indirectly, with the Calcutta standard, and their readings are corrected to the latter:—

Vizagapatam, Mangalore, Bangalore, Mercara, Rajahmundry, Cuddapah, Bellary, Madura, Masulipatam, Negapatam, and Gopalpur.

I here give a list, repeated (with additions) from last year's report, of all those known or believed to be erroneous, together with the needful corrections, where these have been ascertained. The following are certainly erroneous and must be rejected:—

Mooltan, 1875 and 1876.  
 Dera Ismail Khan, June 1885.  
 Simla, from January 1876 to February 1877, and untrustworthy up to the end of April 1880.  
 Rawalpindi, all up to the end of 1881 untrustworthy.  
 Chakrata, January to August 1875, and very doubtful up to the end of 1876.  
 Jhansi, January to April 1875.  
 Benares, February 1876.  
 Sambalpur, 1876.  
 Saugor, Central Provinces, all published up to December 1879; also January, March, May, July, and September 1880, and February and April 1881.  
 Chanda, from January 1875 to June 1876.  
 Buldana, 1876.  
 Amraoti, 1875.  
 Chikalda, from November 1879 to August 1881.  
 Bickaneer, up to the end of 1879.  
 Mount Abu, January 1878, and from April to December 1882.  
 Pachpadra, all published up to 1881 inclusive.  
 Trincomalee, 1877.  
 Moulmein, 1878 and 1879, and from May 1885 to the end of the same year.  
 Toungeoo, all from 1882 to present date.<sup>1</sup>

And the following corrections are to be made to the tables published in previous reports:—

|                                                                                              |   |   |   |   |   |   |        |

| Rangoon, a correction increasing from 0 in January 1876 to a maximum in<br>December 1879 of . . . . . | +0.007 |
| Moulmein, from January 1876 to March 1877 . . . . .                                                   | —0.048 |
| Mergui, from the beginning of the registers in September 1877 to December<br>1879 . . . . .           | +0.021 |

In addition to the above, it is to be noticed that there are inconsistencies in the registers of former years at the following station, which remain to be explained:—

Newera Eliya, from July 1873 to January 1879, with those before and after.

In all cases, except those of Dehra and Bickaneer, the barometers are kept in a masonry building, to protect them as much as possible from changes of temperature. At these two stations alone, they are suspended in the thermometer sheds. The elevations of all barometers have been ascertained with such accuracy as was possible. In the large majority of cases, they have been referred to datum levels determined by the Great Trigonometrical Survey of India; in Northern India, for the most part, by lines of spirit levels connected with the main line of levels between Kurrachee and Calcutta. Elsewhere, the elevations of the Great Trigonometrical Survey stations measured trigonometrically, or those of the lines of railway, have been adopted as reference data; only those of Kailang, Pachpadra and Pithoragarh have been barometrically determined. For some further details, the reader is referred to Table I.

Table VII (Appendix) gives an abstract of the barometric observations of 1886, *viz.*, the monthly means of the readings at each hour of observation and of the day, the monthly mean diurnal range (between 10 A.M. and 4 P.M.), the highest and lowest readings of each month and of the year, and the extreme monthly and annual ranges. The mean pressures have been obtained in the following manner:—

- (a) At Calcutta (Alipore), the means of the hourly measurements of the barograph traces, reduced to the corresponding values of the old Calcutta standard.
- (b) At Bombay (Colaba) and at Leh, the means of the four readings, at the same hours as furnish the data for temperature means, with additive corrections, deduced from the hourly readings at the same observatories in past years.
- (c) At Lahore, Chamba, Jeypore, Allahabad, Saugor Island, and Vizagapatam, the means of the four readings at 4h., 10h., 16h., and 22h., without further corrections.
- (d) At stations in the North-Western Provinces (excepting Allahabad and Ghazipur), Ajmere and Sambhar, Akyab, and stations in Bengal and Assam (except Darjeeling, Pedong, Calcutta (Alipore), Saugor Island, and Dhubri), the means of the 10h. and 16h. observa-

tions corrected by range factors, derived from the six-hourly readings at the same or neighbouring stations in past years. In the latter cases, the factors are taken from the same stations as in the case of the temperature means (see *ante*, page 32).

- (e) At the four Bombay stations, Belgaum, Poona, Deesa and Kurrachee, the means of the 10h. and 16h. observations, with additive corrections, derived from the hourly observations of the same stations in past years.
- (f) At the stations in Madras, including Bangalore and Secunderabad (but excepting Gopalpore, Vizagapatam, Mercara, Kurnool, Rajahmundry, Cuddapah, and Mangalore), the means of the three readings at 10h., 16h. and 22h., corrected by means of range factors, derived from the Madras hourly observations in past years. At Madura, Coimbatore and Masulipatam the means of the 10h. and 16h. observations only, similarly corrected.
- (g) At all other stations the crude means of the 10h. and 16h. observations without correction.

In the case of the Ceylon stations, the observations at  $9\frac{1}{2}$  and  $15\frac{1}{2}$  hours are given in lieu of those at 10 A.M. and 4 P.M.

Table VIII (Appendix) gives the mean pressure of each month, reduced to its sea-level value, from the elevations given in Table I (*ante*), at the temperatures obtained by taking the means of those in Tables V and VII of the Appendix. The readings of the hill stations are not included in this table. The isobars on the charts, plates II to IV, are laid down from these values.

Table XIV, on the next page, gives the average monthly and annual pressure at 125 stations, *viz.*, all that have furnished trustworthy readings, corrected to the Calcutta, Madras, or Ceylon standards, during three years and upwards. In instances in which, during the period included, there has been any change in the elevation of the barometer, a correction has been applied to the former means, to bring all to their equivalent values at their present actual levels. These cases are not numerous, nor, as a rule, are the changes more than a very few feet.

The table also gives, for nearly all stations, the average pressure of the last twelve years, and also, in the case of the Bengal stations and some of those in the North-Western Provinces, the Punjab, Madras, and other provinces, those of longer periods. This double form has been adopted, because the high pressures which prevailed during two years from the spring of 1876 to the autumn of 1878 (brought prominently to notice in the Reports for 1877 and 1878), rendered, for a time, the averages of some stations for which more prolonged registers are not available, somewhat too high, in comparison with those deduced from longer periods.<sup>1</sup> Some of the stations, for which twelve years' averages are given, have not actually furnished registers for the whole period. But, as there exist, in nearly all parts of the country, other stations, from which the complete series is forthcoming, it has been possible, in the case of the defective registers, to interpolate values for the deficiencies; in computing which, the nearest stations, in all directions, have been taken into account, with weights proportional to their respective distances, where there is much variation in this respect.

Tables XV A and B (which follow) shew the differences of the means of 1886 and the above averages, respectively.

Table XVI gives a geographical summary of the anomalies of Table XVA, uniformly with the table of temperature anomalies.

<sup>1</sup> The low pressures of recent years have now, in many cases, counterbalanced this anomaly.

TABLE XIV.—Average monthly Mean Pressures of 128 stations in India, Ceylon, &amp;c.

| STATIONS.              | Years. | January. | February. | March. | April. | May.   | June.  | July.  | August. | September. | October. | November. | December. | Year.  |

The above tables shew the variations in the horizontal distribution of pressure. Its variations in a vertical direction, or, in other words, the varying density of the lowest stratum, which lies between the level of the plains and that of the hill stations, is shewn approximately by the differences of pressure on the former and at the latter; observing however, that, as there must always be an interval of some miles between any hill station and the nearest station on the plains, these differences must also be affected to some small extent by a horizontal difference, of an amount not accurately determinable. If the pairs of stations are well selected, this horizontal difference will, however, not be large when a comparison is made of the average pressures of a whole month; and if considerable accuracy is required, an approximate correction may be deduced, by considering the course of the isobars on the monthly charts, and the relative positions of the stations. For the present purpose, which is merely to compare the barometric weights of the lower air stratum, in each month, with that furnished by the average of many years, this precaution may be dispensed with; since the variations in the average course of the isobars, in the corresponding months of different years, are not sufficiently great, in most parts of India, appreciably to affect the results of such a comparison.

The following tables, XVII and XVIII, give the average differences of pressure at nine hill stations, and the nearest stations on the plains below, *viz.*, five Himalayan hill stations, one in Western, and three in peninsular India—the averages being in no case taken from less than six years. The pairs of stations selected, together with their horizontal distances and differences of elevation, are as follow:—

| PAIRS OF STATIONS. |             | Horizontal distance. | ELEVATION IN FEET. |        | Difference. |
|--------------------|-------------|----------------------|--------------------|--------|-------------|
| Hills.             | Plains.     |                      | Upper.             | Lower. |             |

*January.*—The pressure had been considerably above the average over the whole of India during the months of September, October, and November 1885. This excessive pressure almost disappeared in December. The mean pressure of the month of January was '011" below the average with respect to this general condition. Pressure was locally in defect in Southern India, whilst it was in excess over the whole of Northern and Central India. The local variations from the average state were almost without exception small. There was apparently a very considerable local excess of pressure on the Sikkim Himalayas, where pressure was '017" in excess of the normal or '017" + '011", i.e., '028" in excess of the average pressure condition of the month for the whole of India. There was a much smaller local excess in Orissa ('012") and a defect in Arakan and Pegu which amounted to '010". Table XV shows that pressure was in excess at Darjeeling as compared with the neighbouring plains and also at Wellington in Southern India.

| Delhi . . . . .            | '027"                                              |

Neither the charts of the 20th or 21st show the presence of an area of low pressure in Northern India. The depression disappeared completely before the morning of the 20th, although it influenced the weather until the evening of that day. This was shewn by the extension of rainfall from the hills of the Punjab to those of the North-West Provinces on the 19th, and by the occurrence of light showers on the 20th in the eastern districts of the North-West Provinces and Behar.

A second disturbance similar in character occurred on the small scale on the 23rd. The barometer fell rather rapidly on the 22nd, and a slight depression appeared in the North Punjab on the morning of the 23rd. Light showers of rain or snow fell on that day, but the depression filled up, and the rain ceased without extending eastwards along the Himalaya and Gangetic plain as it did on the preceding occasion. From the 23rd to the 30th clear fine light weather with anticyclonic conditions prevailed over Northern India, after which a moderately rapid fall of the barometer ensued.

The following gives the amount of the fall at several stations :—

| STATIONS.                  | Fall from 10 A.M. of 30th to 10 A.M. of 31st. |
|----------------------------|-----------------------------------------------|
| Peshawar . . . . .         | ·180"                                         |
| Dera Ismail Khan . . . . . | ·178"                                         |
| Mooltan . . . . .          | ·211"                                         |
| Lahore . . . . .           | ·155"                                         |
| Delhi . . . . .            | ·152"                                         |
| Simla . . . . .            | ·109"                                         |
| Murree . . . . .           | ·179"                                         |
| Rawalpindi . . . . .       | ·171"                                         |
| Bareilly . . . . .         | ·047"                                         |
| Jacobabad . . . . .        | ·060"                                         |

The barometer rose more slowly but steadily from the 1st to the 3rd of February, as is shown by the following :—

|                            | Rise from 10 A.M. of 31st to 10 A.M. of 1st. | Rise from 10 A.M. of 1st to 10 A.M. of 2nd. | Rise from 10 A.M. of 2nd to 10 A.M. of 3rd. | TOTAL RISE. |
|----------------------------|----------------------------------------------|---------------------------------------------|---------------------------------------------|-------------|

| Lahore . . . . .           | ·066"                                        | ·080"                                       | ·148"                                       | ·294"       |
| Delhi . . . . .            | ·041"                                        | ·100"                                       | ·103"                                       | ·244"       |
| Simla . . . . .            | —·026"                                       | ·024"                                       | ·042"                                       | ·040"       |
| Murree . . . . .           | ·014"                                        | —·010"                                      | ·140"                                       | ·144"       |
| Rawalpindi . . . . .       | ·072"                                        | ·031"                                       | ·193"                                       | ·296"       |
| Bareilly . . . . .         | —·064"                                       | ·070"                                       | ·071"                                       | ·075"       |
| Jacobabad . . . . .        | ·103"                                        | ·052"                                       | ·123"                                       | ·278"       |

This barometric movement was hence different in character to some degree from the preceding. There was however no translation of a condition of low pressure or a cyclonic whirl from Afghanistan through the Punjab. It can apparently only be explained by the assumption of some oscillatory action which produced first of all a large and rapid decrease and immediately afterwards a steady prolonged and large increase of pressure.

The period of falling barometer preceded and accompanied heavy snowfall on the Safid Koh Mountains to the west of the Indus Valley, and was followed by light rain in those to the east of the Punjab. But in this, as on the previous case, there was no transmission of effect eastwards or southwards beyond the Punjab. The large fall of the barometer in the Indus Valley and the subsequent larger rise were apparently directly related to the general conditions preceding and following the snowfall in the mountains of Afghanistan.

*February.*—The mean pressure of the whole of India for the month of February was + '009" above the normal pressure. The local variations were rather large. They were positive in the Punjab, Rajputana, Nerbudda Valley, Orissa, Central Provinces, and the Deccan, and negative in all other districts. The positive local variations exceeded '01" in the following districts :—

| PROVINCES.                | Barometric excess. |
|---------------------------|--------------------|
| Punjab . . . . .          | + '015"            |
| Rajputana . . . . .       | + '019"            |
| Nerbudda Valley . . . . . | + '024"            |
| Orissa . . . . .          | + '011"            |

and the negative variations exceeded '01" in—

| PROVINCES                | Barometric defect. |
|--------------------------|--------------------|
| Himalayan area . . . . . | — '017"            |
| Assam . . . . .          | — '026"            |
| Malabar . . . . .        | — '019"            |
| Ceylon . . . . .         | — '013"            |
| Arakan . . . . .         | — '011"            |
| Bay Islands . . . . .    | — '017"            |

The local variations were thus rather larger than they had been in January. Amongst the more remarkable variations of the small areas represented by single stations, the following are the more remarkable :—

| STATIONS.                  | Relative barometric excess or defect. |
|----------------------------|---------------------------------------|
| Jacobabad . . . . .        | + '041"                               |
| Quetta . . . . .           | + '033"                               |
| Mooltan . . . . .          | + '031"                               |
| Dera Ismail Khan . . . . . | + '032"                               |
| Agra . . . . .             | + '024"                               |
| Jhansi . . . . .           | + '041"                               |
| Jeypore . . . . .          | + '024"                               |
| Ajmere . . . . .           | + '026"                               |
| Leh . . . . .              | — '076"                               |

The chief feature shown by these figures was a very considerable excess of pressure over the Indus Valley and in the neighbouring districts of Beluchistan, and also in the area represented by the stations of Agra, Jhansi, Ajmere, Jeypore, or East and Central Rajputana. Table XVIII shows that the difference between the pressure at the hill stations and the adjacent plain stations was practically identical with the normal, except in Southern India, where the observations at Wellington and Coimbatore prove that although pressure was in defect in the lower strata, it was slightly in excess in the higher strata at the elevation of Wellington.

The first week of February, like the first week of the preceding month, was marked by high pressure and by anticyclonic conditions in Upper India. The disturbance in the Punjab and Afghanistan on the 31st and 1st was followed by a wave of cold, which travelled eastward at an average rate of about 12 miles per hour, or probably with the velocity of the winds that prevailed at some little distance above the earth's surface. The highest pressures during this cool and dry period were observed on the morning of the 9th. The following were the highest barometric readings reduced to sea-level at three stations in the north of the Punjab :—

|                            |         |
|----------------------------|---------|
| Peshawar . . . . .         | 30°352" |
| Dera Ismail Khan . . . . . | 351"    |
| Rawalpindi . . . . .       | 346"    |

The barometer oscillated rapidly and irregularly until the 12th, when a prolonged and large fall commenced and extended over the next 96 hours.

The following gives the daily and total amount of the fall at several stations :—

|                            | Fall from 10 A.M. of the 12th Feb. to 10 A.M. of the 13th. | Fall from 10 A.M. of the 13th Feb. to 10 A.M. of the 14th. | Fall from 10 A.M. of the 14th Feb. to 10 A.M. of the 15th. | Fall from 10 A.M. of the 15th Feb. to 10 A.M. of the 16th. | TOTAL. |
|----------------------------|------------------------------------------------------------|------------------------------------------------------------|------------------------------------------------------------|------------------------------------------------------------|--------|
| Peshawar . . . . .         | ·113"                                                      | ·082"                                                      | ·098"                                                      | ·360"                                                      | ·653"  |
| Dera Ismail Khan . . . . . | ·094"                                                      | ·101"                                                      | ·082"                                                      | ·328"                                                      | ·605"  |
| Mooltan . . . . .          | ·088"                                                      | ·120"                                                      | ·088"                                                      | ·279"                                                      | ·575"  |
| Jacobabad . . . . .        | ·095"                                                      | ·090"                                                      | ·087"                                                      | ·089"                                                      | ·361"  |

These figures are remarkable. They shew that in the narrow confined space of the Punjab a very large and rapid fall of the barometer occurred. The local barometric differences in the North Punjab were small on the 13th, 14th, and 15th, but were very large between the Punjab and adjacent districts to the south, whilst the fall was as large at the elevation of Murree as at the level of the plains 6,500 feet lower. The barometric move-

ment of the 13th to the 15th merely effaced the anticyclonic conditions of high pressure previously established, but the rapid fall of the 16th produced a deep depression covering the whole of the Punjab. A very rapid rise of the barometer during the next 24 hours completely obliterated this depression. The following is the increase of pressure at the stations in the previous list during the 24 hours from 10 A.M. of the 16th to 10 A.M. of the 17th:—

| STATIONS.                  | Barometric rise. |
|----------------------------|------------------|
| Peshawar . . . . .         | ·484"            |
| Dera Ismail Khan . . . . . | ·456"            |
| Mooltan . . . . .          | ·405"            |
| Jacobabad . . . . .        | ·223"            |
| Deesa . . . . .            | ·181"            |
| Jeypore . . . . .          | ·301"            |
| Agra . . . . .             | ·246"            |
| Delhi . . . . .            | ·252"            |
| Lahore . . . . .           | ·402"            |
| Rawalpindi . . . . .       | ·442"            |
| Murree . . . . .           | ·314"            |
| Simla . . . . .            | ·052"            |
| Chakrata . . . . .         | ·023"            |

The charted observations show even more plainly than the figures that a very rapid fall of the barometer extending over four days produced a deep depression in the Punjab on the 14th, which was filled upon the 15th by an even more rapid rise, the character of the rise being exactly similar to that of the preceding fall over the Punjab and the adjacent districts to the south. They also indicate most clearly that the disturbance was not due to the translation of a state or of a cyclonic whirl across the Punjab, but to the production and disappearance of an abnormal state of pressure by local actions in the superjacent atmosphere. These causes are to be sought for in the following conditions:—

1. The narrow confined geographical conditions of the Punjab.
2. The occurrence of ascending currents in the upper south-west humid current, the existence of which is proved by the occasional formation of cloud and the occurrence of snow and rainfall and also by the upper cloud movement.
3. Upheaval or vertical expansion (with little lateral motion) which necessarily precedes or accompanies rain or snow.
4. The cooling of the air to or below the freezing point which takes place after the snow fall in the hills to comparatively low altitudes, depending mainly upon the height of the snow line immediately after the storm.
5. The downrush of cool dry air (after the stormy weather has passed away) from the neighbouring hills into the adjacent valleys and plains.

What proportion each of these causes bear to the production of the effect is doubtful and probably varies with the conditions.

Little is known of the snowfall in Afghanistan at this period. It is, however, reported that a very heavy fall occurred in the hills to the west of Peshawar and Dera Ismail Khan on the 15th and 16th. 10 to 15 feet are stated to have fallen on the Safid Koh, and 2 feet in the Kurram Valley.

No depression appeared in the Upper Indus Valley during the latter part of the month.

The normal cold weather conditions of high pressure and fine clear weather continued until the 26th, when a slight depression appeared in Sind and passed away almost immediately and affected the weather very little.

*March.*—The mean pressure was slightly below the normal, the deficiency averaging  $-.006''$  for the whole of India. The variations from the general or average state were less marked than during the preceding months of January and February. Over the greater part of Northern India pressure was very slightly in excess of the normal, and the variations relative to the mean pressure conditions ( $.006''$  in defect) were considerably in excess in the following districts:—

|                                |          |
|--------------------------------|----------|
| Sikkim Himalaya . . . . .      | $.026''$ |
| Orissa . . . . .               | $.018''$ |
| Bengal . . . . .               | $.015''$ |
| North-West Provinces . . . . . | $.013''$ |
| Nerbudda Valley . . . . .      | $.011''$ |

There was a slight local deficiency in the Punjab and adjacent hill districts. The only marked feature in the pressure at the hill stations was an excess at Wellington, which contrasted strongly with the slight deficiency of pressure which prevailed in the plain districts of Southern India.

The following gives the most important local variations in the smaller areas represented by a single station:—

| STATIONS.             | Relative<br>barometric<br>excess or defect. |
|-----------------------|---------------------------------------------|
| Leh . . . . .         | $-.076''$                                   |
| Peshawar . . . . .    | $-.034''$                                   |
| Kailang . . . . .     | $-.036''$                                   |
| False Point . . . . . | $+.020''$                                   |
| Sambalpur . . . . .   | $+.025''$                                   |
| Burdwan . . . . .     | $+.020''$                                   |
| Gopalpur . . . . .    | $+.023''$                                   |

The large negative variations at the first three stations show that the deficiency in the Punjab during the month was most marked in the extreme northern districts and in the hill districts. The area between Bengal and the Central Provinces continued to be characterized by excessive pressure. It was most marked during the month of March in the coast districts of Orissa and Ganjam and in Sambalpur.

The hot weather usually commences during this month in Northern India, and the changed conditions modify considerably the pressure relations and variations.

A small depression appeared in Rajputana on the 3rd. It was transferred to Chutia Nagpur on the 4th, to Orissa and Central Bengal on the 5th, and then disappeared. It was very slight throughout. There was some cloud formed, the air was slightly cooler and damper, and a considerable shift of wind occurred in the districts it passed through, but it only gave a few light showers in East Bengal.

A second depression, similar in character, but more distinctly marked and accompanied with heavy rain, followed during the next week. It appeared in Sind on the morning of the 6th, and probably (although that is not quite certain from the paucity of observations) passed from Beluchistan eastwards. The amount of the depression was very small compared with that of the stationary depressions in the Punjab during January

and February. It occupied nearly the whole of Rajputana and Central India (enclosed by the isobar of 29.90") on the 7th, and light showers fell to the north and east, but chiefly in and near the hills. It covered Central and Eastern Rajputana, and Bundelkund (enclosed by the isobar of 29.9") on the morning of the 8th, and larger amounts of rain fell in and near the hills of the Punjab and the North-Western Provinces to the west of Bareilly. It lay over the south and south-eastern districts of the North-Western Provinces and the northern districts of the Central Provinces on the 8th, which were enclosed by the isobar of 29.75". The depression had increased considerably and showers fell over the whole of Northern India from Bengal to the Punjab. A rapid rise of the barometer commenced on the afternoon of the 9th, and the depression completely disappeared on the morning of the 10th. This depression differed entirely in its characteristics from the previous disturbances of the months of January and February. It was very small in amount. It probably entered Sind from Beluchistan, and it marched eastwards to the borders of Behar and Chutia Nagpur, and gave rain to the whole of Northern India in moderate amounts.

Anticyclonic conditions afterwards obtained in Northern India with fine dry weather and clear skies until the 15th, when a depression began to appear or form in North Sind. Its existence was shewn by the observations at Jacobabad and Quetta. It extended to West Rajputana on the 16th, and disappeared on the evening of that day without having given rise to any considerable disturbance or rainfall. A depression appeared in the mid-Indus Valley on the morning of the 25th. The barometer fell from 29.84" on the 24th to 29.74" on the 25th at Mooltan. A moderate cyclonic circulation was established over the area of depression. It was transferred to the central districts of Rajputana (Bickaneer) on the 26th. The circulation was more irregular on the 27th, but the centre was probably to the west of Delhi. There was no trace of its existence on the 28th. It gave some slight showers in the hills, and at one or two stations in the Punjab plains.

A depression appeared in the North Punjab on the 30th. The following gives the barometric changes during the 24 hours preceding 10 A.M. of each day:—

| STATIONS.            | 30th.  | 31st.   | 1st.    |
|----------------------|--------|---------|---------|
| Rawalpindi . . . . . | —'288" | + '146" | + '066" |
| Peshawar . . . . .   | —'250" | + '197" | + '047" |
| Sialkot . . . . .    | —'240" | + '102" | + '090" |
| Lahore . . . . .     | —'168" | + '077" | + '116" |
| Delhi . . . . .      | —'120" | + '054" | + '018" |
| Roorkee . . . . .    | —'118" | + '008" | 0       |
| Agra . . . . .       | —'112" | + '062" | + '010" |
| Mooltan . . . . .    | —'086" | + '101" | + '088" |
| Murree . . . . .     | —'263" | + '112" | + '054" |
| Simla . . . . .      | —'110" | —'134"  | + '020" |
| Chakrata . . . . .   | —'033" | —'145"  | —'003"  |

There were slight indications of disturbance in the North Punjab on the 28th, as showers fell at the most northerly stations, but it was not until the morning of the 30th, that a well-marked depression and fairly regular cyclonic circulation was formed which

It is not possible to decide from the observations whether this depression passed into the Punjab from the north-west, or whether it was formed mainly or entirely in the Punjab itself. It certainly had many of the characteristic features of the stationary depression of January and February, and so far as I can judge it belongs to that class.

The rapid increase of temperature in April produces a gradual change in the distribution of pressure, the chief of which are the transference during the month of the area of lowest pressure from the Deccan or Central India to the Punjab, and the intensification of the depression. Accompanying this large change are frequently large and rapid fluctuations. These periods of large barometric movement are generally also periods during which thunder-storms, hail-storms, and norwesters occur over large areas in northern and Central India, and more especially in Bengal and Orissa. It is very rarely that a large and persistent depression and cyclonic storm is formed either in the Bay of Bengal or in Upper India during this month.

The month was unusually free from thunder-storms and dust-storms, and the fine weather oscillations of the barometer (average period about three days) were such as ordinarily occur in India. No depression accompanying stormy weather appeared in Upper India or passed into India from the adjacent seas.

|                      |   |   |   |   |   |
|----------------------|---|---|---|---|---|
| Sikkim Himalayas     | + | 0 | 2 | 7 | " |
| Orissa               | + | 0 | 2 | 6 | " |
| Chutia Nagpur        | + | 0 | 2 | 5 | " |
| North-West Provinces | + | 0 | 2 | 6 | " |
| Bengal               | + | 0 | 2 | 4 | " |
| Assam                | + | 0 | 1 | 6 | " |

and the negative exceeded '01 in the following districts :—

|                             |        |
|-----------------------------|--------|
| Western Rajputana . . . . . | —'020" |
| Konkan . . . . .            | —'026" |
| Ceylon . . . . .            | —'026" |
| Malabar . . . . .           | —'029" |
| Deccan . . . . .            | —'021" |

The weather was unusually disturbed throughout May, as frequently happens after a quiet month of April. The barometric fluctuations were occasionally very large and rapid, and the area of minimum pressure was at such periods transferred rapidly from one part of the country to another.

A local depression formed in the Punjab on the 6th with winds cyclonic in direction. It was transferred to the south-east during the following day, filling up with its advance. It gave rain in the hill districts from Murree to Naini Tal. An early advance of moist winds up the east side of the Bay gave low pressure and squally weather to South Burma on the 8th and 9th. The disturbance passed into Upper Burma on the 10th and then apparently filled up. It was not at any time a definite and well marked cyclonic disturbance.

A small disturbance appears to have formed in the south-west of the Bay on the 22nd and 23rd. It advanced across the coast between Madras and Negapatam, and gave a deluge of rain to the Negapatam and Trichinopoly districts, and general rain in Southern India. At the same time a wave of low pressure began to run along the west coast of India and carried heavy rain with it. The following gives the lowest pressure on each day :—

| STATIONS.           | Date. | Lowest reading at 10 A.M. | Difference from normal. |
|---------------------|-------|---------------------------|-------------------------|
| Cochin . . . . .    | 24th  | 29'689"                   | —'209                   |
| Karwar . . . . .    | 25th  | '568"                     | —'297                   |
| Ratnagiri . . . . . | 26th  | '625"                     | —'221                   |
| Surat . . . . .     | 27th  | '592"                     | —'234                   |

The effect of this northward rush of moist winds carrying low barometer with them appears to have ceased on the evening of the 27th. The advance of this area of low barometer and of somewhat irregular cyclonic circulation and squally weather coincided with the first burst of the monsoon on the Malabar coast. \*

*June.*—The mean pressure of India for the month of June varied very slightly from the normal. There was a slight deficiency which averaged only —'002". Relatively to this general deficiency pressure was in defect in Assam, the Central Provinces, the Konkan, Malabar coast, the Deccan, the Carnatic, Ceylon, Arakan, and the Bay Islands. The deficiency was nowhere large, but it exceeded '01" in the following areas :—

| DISTRICTS.            | Relative barometric defect. |
|-----------------------|-----------------------------|
| Malabar . . . . .     | —'025"                      |
| Bay Islands . . . . . | —'023"                      |
| Ceylon . . . . .      | —'023"                      |
| Deccan . . . . .      | —'016"                      |
| Konkan . . . . .      | —'013"                      |

Hence, as in the previous months, the local deficiency of pressure was greatest in the south of the Bay, Ceylon, and the southern districts of the Peninsula. Pressure was relatively to the general variation locally in excess in North and North-West India and the Central Indian States. The excess exceeded '010" in the following districts:—

| DISTRICTS.                     | Barometric excess. |
|--------------------------------|--------------------|
| Sikkim Himalaya . . . . .      | + '027"            |
| North-West Provinces . . . . . | + '021"            |
| Punjab . . . . .               | + '018"            |
| East Rajputana . . . . .       | + '013"            |
| Chutia Nagpur . . . . .        | + '020"            |

Pressure at the elevation of the hill stations was slightly higher at those in Northern India, and lower at those in Central and Southern India,—in other words, the difference of pressure between the plains and hill stations was less than usual in Northern India (the feature being most marked in the Eastern Himalaya as represented by Darjeeling) and was greater than usual in Central and Southern India, the variation in this case increasing in amount from Central to Southern India. The gradients at a height of 6,000 to 8,000 feet were hence smaller than usual.

A frequent feature of the rains is the formation of small barometric depressions or cyclonic whirls, sometimes in the Bay and sometimes over the land. The heaviest rainfall during the south-west monsoon usually occurs in the districts passed over by these storms. The following gives a brief account of the depressions of the month of June.

*1st.—Depression of June 1st and 2nd in South Bengal.*—This formed quite at the head of the Bay and was very shallow on the 1st. The centre crossed the coast of the Sunderbunds on the 2nd, probably midway between Saugor Island and Chittagong. It filled up during the next 24 hours. The chief feature connected with it was an exceptionally heavy burst of rain at Chittagong. It received 14'69" inches on the 2nd during the storm. The following gives the lowest readings recorded on the 1st and 2nd:—

| STATIONS.          | Date.        | Lowest reading at 10 A.M. | Difference from normal. |
|--------------------|--------------|---------------------------|-------------------------|
| Calcutta . . . . . | 1st, 10 A.M. | 29'554                    | —'054                   |
| Ditto . . . . .    | 2nd, 10 A.M. | '558                      | —'050                   |

*2nd.—Depression of June 7th and 8th, in East Bengal.*—This was apparently land formed and was very slight and feeble. It was generated by the action of a rush of monsoon winds up the east coast, and by the occurrence of heavy rain. Chittagong recorded 7 inches.

The depression filled up without moving.

*3rd.—Depression of 12th to the 22nd June.*—This was an important and long-lived depression which developed slowly at the head of the Bay, and advanced west-north-west and gave the first general burst of the monsoon rains to the whole of Northern India. It began to form on the 12th in front of an advancing strong humid current up the Bay. The depression lay to the south of Saugor Island and off the Orissa coast on the 13th,

14th, and 15th, during which period it intensified very considerably and advanced very slowly, and was, on the morning of the 15th, a vigorous and extensive cyclone covering the whole of the Bay to the north of Lat. 16°. It then began to move more rapidly and crossed the coast near Saugor Island at 10 A.M. on the 16th. It passed through Orissa, the southern districts of Chutia Nagpur, and the north-eastern districts of the Central Provinces on the 17th. The centre was a little to the south-west of Benares at 10 A.M. of the 18th. Heavy rain fell in Bengal, Behar, Chutia Nagpur, and the eastern districts of the North-West Provinces during the preceding 24 hours. The depression passed through Bundelkund on the 19th, the centre lying between Jhansi and Nowgong at 10 A.M. Very heavy rain fell over the eastern districts of the North-West Provinces during the previous period of 24 hours. It thence passed into Eastern Rajputana and advanced to the north-west. It was approaching the Punjab frontier at 10 A.M. of the 20th. Heavy rain had again fallen over the districts to the north of the track of the cyclone, that is, the western half of the North-West Provinces. It crossed into the Punjab during the day, and the centre was to the west of Lahore on the 21st. It continued to advance to the north-west, but was broken up as it moved into the contracted area of the Upper Punjab. It however gave heavy rainfall on the 20th and 21st to the eastern districts of the Punjab and the adjacent hill districts. The following table gives the lowest observed reading of the barometer on each day at the observing stations nearest the centre, and the amount of the depression.

| STATION.                | Date.         | Lowest barometer reading at 10 A.M. | Difference from normal. |
|-------------------------|---------------|-------------------------------------|-------------------------|
| Saugor Island . . . . . | 16th, 10 A.M. | 29'112"                             | —'497"                  |
| Sambalpur . . . . .     | 17th, do.     | '357"                               | —'226"                  |
| Benares . . . . .       | 18th, do.     | '327"                               | —'241"                  |
| Nowgong . . . . .       | 19th, do.     | '412"                               | —'160"                  |
| Sirsa . . . . .         | 20th, do.     | '443"                               | —'086"                  |
| Lahore . . . . .        | 21st, do.     | '472"                               | —'035"                  |

*July.*—The general features of the distribution of the average pressure of the month were very similar to those of the preceding month of June. The average pressure of the whole of India was slightly in defect ('005"). Over Southern India, the Deccan, the Central Provinces, Ceylon, and the south and centre of the Bay pressure relative to the general state was below the average. The following give the amounts for those districts in which it exceeded '01"—

|                       |       |
|-----------------------|-------|
| Ceylon . . . . .      | '027" |
| Bay Islands . . . . . | '025" |
| Malabar . . . . .     | '018" |
| Deccan . . . . .      | '016" |

Pressure was relatively to the general condition in excess in North-West and North-East India. The excess was greater than '01" in the following districts:—

|                                |       |
|--------------------------------|-------|
| Sikkim Himalayas . . . . .     | '016" |
| North-West Provinces . . . . . | '016" |
| Bengal . . . . .               | '013" |
| Chutia Nagpur . . . . .        | '019" |

The above shews that the pressure conditions and variations of July were almost identical with those of June in the lower strata. A reference to Table XVIII will shew that the same is also true for the variations in the higher levels of the atmosphere (*i.e.*, 6,000 to 8,000 feet).

The following gives a brief account of the chief depressions of the month:—

*Depression of the 16th to the 23rd.*—The logs of vessels giving meteorological information of the Bay indicate that this depression formed on the 15th and 16th, when weather began to be very squally and rough. It was well developed on the 17th, and occupied the north-west angle of the Bay. It crossed the North Orissa coast on the evening of the 17th, and advanced through Orissa and Sambalpur on the 18th. It gave moderate rain on the 17th and 18th to Bengal and Orissa, and drew much moisture from the Bombay coast to the Central Provinces, which gave that area very heavy rain on the 18th. It moved through the broken and sparsely populated districts between Sambalpur and Sutna and Jubbulpore on the 19th. The rainfall was more general and widely diffused in that area than hitherto, and the depression was less clearly marked. It was between Sutna and Jubbulpore on the morning of the 21st, when heavy rain fell over the whole of the north-eastern districts of the Central Provinces. The depression then intensified, and occupied nearly the same area on the 22nd. The cyclonic circulation was not very regular at this time. The centre was probably a little to the south-west of Sutna. The depression advanced rapidly to the west during the next 24 hours through Central India and South Rajputana, and disappeared before the morning of the 24th. Heavy rain fell in Guzerat and Central India on the 22nd and 23rd.

The following give the greatest observed depression on each day of its existence:—

| Position.               | Date. | Lowest barometer<br>at 10 A. M. | Difference from<br>normal. |
|-------------------------|-------|---------------------------------|----------------------------|
| False Point . . . . .   | 16th  | 29'488"                         | —'136"                     |
| Saugor Island . . . . . | 17th  | '456"                           | —'140"                     |
| Cuttack . . . . .       | 18th  | '430"                           | —'189"                     |
| Benares . . . . .       | 19th  | '459"                           | —'111"                     |
| Raipur . . . . .        |       | '458"                           | —'156"                     |
| Benares . . . . .       |       | '485"                           | —'085"                     |
| Sutna . . . . .         | 21st  | '478"                           | —'096"                     |
| Sutna . . . . .         | 22nd  | '377"                           | —'197"                     |
| Neemuch . . . . .       | 23rd  | '363"                           | —'258"                     |
| Deesa . . . . .         |       | '389"                           | —'225"                     |

The preceding table shews clearly one of the most general features of cyclonic storms that cross the Peninsula, *viz.*, the gradual decrease of the intensity of the storm as measured by the barometric depression which occurs as the storm passes into the interior from the Bay, and its increase when it approaches the Bombay coast.

*August.*—The variations of the mean pressure of the month from the normal means were even smaller than during the previous two months. The average pressure for the whole of India only differed from the mean pressure of the month by —'002". The local variations were also smaller, but were similar in general character to those of the previous months of June and July. The local variations were positive over the whole of North and North-Eastern India, and the Konkan. They only exceeded '01" in two districts,

*viz.*, Bengal ( $\cdot 013''$ ) and Chutia Nagpur ( $\cdot 021''$ ). They were, on the other hand, negative in the Deccan, Southern India, Ceylon and the centre of the Bay, and were greatest in the extreme south of India and in Ceylon. They averaged  $\cdot 015''$  for the Ceylon stations, and  $\cdot 020''$  for the Bay Islands. The preceding remarks give the more prominent features of the variation of pressure of the month from the normal distribution. There were some local examples of large variations which deserve record.

These were :—

|                         |                 |
|-------------------------|-----------------|
| Leh . . . . .           | - $\cdot 034''$ |
| Ranikhet . . . . .      | - $\cdot 024''$ |
| Masulipatam . . . . .   | - $\cdot 032''$ |
| Bangalore . . . . .     | - $\cdot 024''$ |
| Port Blair . . . . .    | - $\cdot 033''$ |
| Jhansi . . . . .        | + $\cdot 023''$ |
| Hazaribagh . . . . .    | + $\cdot 021''$ |
| Sambalpur . . . . .     | + $\cdot 018''$ |
| Saugor Island . . . . . | + $\cdot 021''$ |

The large negative variations at Port Blair and Masulipatam are the most striking examples during the month of August, of a feature that came into prominence in the months of September, October and November, *viz.*, the marked tendency to relatively low pressure across the centre of the Bay from the Andamans to the mid-west coast, whilst the relatively high pressure indicated by the stations of Hazaribagh, Sambalpur and Saugor Island, and to a slightly less extent at the neighbouring stations to the west, is closely related to the light rainfall in the Central Provinces and Chutia Nagpur (more especially the southern districts) at this time.

The following gives a brief account of the more important depressions of the month, which formed or crossed into the Indian land area.

*Depression of August 11th to 21st.*—Pressure was very low at the commencement of the month in the Punjab, and a strong monsoon blew up the Bay of Bengal, and gave fairly general rain over the whole of Northern India until the 8th. It fell off in strength on the 9th, and a break in the rains set in on the 10th. During the next four days, the 11th, 12th, 13th and 14th, there was a small and imperfect depression off the west coast of the Bay of Bengal, between Masulipatam and Vizagapatam. Vessels in this part of the Bay encountered squally weather, and the winds were cyclonic in direction, but were comparatively feeble except during the squalls. Much rain also fell, but chiefly in heavy showers during squalls. The centre of the storm was in Lat.  $18^{\circ}$  N. and Long.  $85\frac{1}{2}^{\circ}$  E. at 10 A.M. of the 15th, and advancing very slowly to the north-north-east. The depression at the centre increased during the next 48 hours. The centre, at 10 A.M. of the 17th, was about 70 miles to the east of Gopalpur. It crossed the coast of Orissa nearly midway between False Point and Gopalpur on the 18th and recurved during the day, passing across the Orissa Hills in a N. W. direction into Sambalpur. The lower cyclonic circulation was less regular on the 19th, but showed convergence to a centre nearly midway between Raipur and Sambalpur at 10 A.M. The strong indraught from the Bombay coast which now commenced gave very heavy rain in the Central Provinces, and the rainfall at this time was almost entirely confined to the west and south-west quadrants of the area of disturbance. The storm passed through the north and north-west districts of the Central Provinces into Central India on the 20th, and on the 21st it crossed through Malwa and part of Meywar, the centre being near to Neemuch at 10 A.M. The depression was now

very small, and the cyclonic circulation became more irregular during the day, and it is hence probable that the storm filled up in South-West Rajputana. The following gives the position of the centre on each day:—

| POSITION.                          | SHIP'S POSITION AT NOON. |          | Date. | Distance and bearing of centre. | Barometer reading. | Difference from normal. |
|------------------------------------|--------------------------|----------|-------|---------------------------------|--------------------|-------------------------|
|                                    | Lat. N.                  | Long. E. |       |                                 |                    |                         |
| Ship <i>Lochee</i> . . . . .       | 17°36"                   | 87°42"   | 15th  | 150 miles W . . .               | 29°450"?*          | —'207?                  |

| Ship <i>Barque Harvard</i> . . . . | 18°46"                   | 86°58"   | 16th  | 70 miles W . . .                | '407"?*            | —'250?                  |
| Gopalpur . . . . .                 | ...                      | ...      | 17th  | 70 miles E . . .                | '486"              | —'193                   |
| Cuttack . . . . .                  | ...                      | ...      | 18th  | 40 miles S . . .                | '435"              | —'240                   |
| Sambalpur . . . . .                | ...                      | ...      | 19th  | 80 miles E . . .                | '454"              | —'188                   |
| Jubbulpore . . . . .               | ...                      | ...      | 20th  | 110 miles ESE . .               | '526"              | —'161                   |
| Neemuch . . . . .                  | ...                      | ...      | 21st  | 80 miles S . . .                | '573"              | —'113                   |

\* Uncorrected.

*Depression of August 22nd to 24th.*—A very small depression formed in the north-west angle of the Bay between False Point and Saugor Island on the evening of the 21st and morning of the 22nd. It advanced into South-West Bengal on the 23rd, the centre being between Saugor Island and Calcutta. Heavy general rain was falling at this time over the whole of Northern India, and the whirl, though very distinct, neither increased in intensity nor magnitude. The centre was nearly midway between Calcutta and Berham-pur on the 24th. It filled up during the evening of the 24th, after giving moderate rain to South and East Bengal. The depression was unusually small in amount as is shown by the following:—

| POSITION.               | Date. | Distance and bearing of centre. | Lowest reading at 10 A.M. | Difference from normal. |
|-------------------------|-------|---------------------------------|---------------------------|-------------------------|
| Saugor Island . . . . . | 22nd  | 40 miles NNE . .                | 29°644                    | —'012                   |
| Calcutta . . . . .      | 23rd  | 30 miles N . . .                | '649                      | —'013                   |
| Calcutta . . . . .      | 24th  | 35 miles SW . . .               | '636                      | —'026                   |

A very small depression appeared in South-West Bengal on the morning of the 28th (apparently land-formed), but it filled up before 10 A.M. of the 29th.

*September.*—The mean pressure of the month almost exactly coincided with the normal, excess pressure in Northern India compensating deficient pressure in Southern India. The variations of the mean pressure of the meteorological districts from their average pressure conditions were in several cases large, amongst which the more important were:—

|                             |         |
|-----------------------------|---------|
| Rajputana . . . . .         | + '026" |
| Nerbudda valley . . . . .   | + '022" |
| Central Provinces . . . . . | + '011" |
| Konkan . . . . .            | + '011" |
| Ceylon . . . . .            | — '023" |
| Bay Islands . . . . .       | — '022" |
| Punjab . . . . .            | — '017" |
| Malabar . . . . .           | — '019" |
| Carnatic . . . . .          | — '015" |

These large variations accompanied a more unequal distribution of the rains than is usual in September.

The following gives a short account of the more important depressions and cyclonic storms which formed during the month of September.

*1st.—Depression of September 5th to 11th.*—There was at this period of the monsoon a very strong tendency to the formation of depressions in Behar and the neighbouring districts. On the 5th and 6th a very slight depression appeared in the eastern districts of the North-West Provinces, and heavy rain fell in those districts and Behar. There was much irregular cyclonic circulation on the 7th, and it began to concentrate and intensify about a centre in Central Behar. The depression was very distinctly marked on the 8th, when the centre was between Patna and Gya. It moved slightly to the east during the next 24 hours, and the depression covered the whole of Behar and the northern districts of Chutia Nagpur. Heavy rain fell on the 8th, 9th and 10th, and the depression continued unaltered in position or character until the morning of the 11th, when it filled up rapidly and disappeared.

The following statement gives the lowest readings of the barometer recorded during the storm :—

| STATIONS.           | Date. | Lowest reading at 10 A.M. | Difference from normal. |
|---------------------|-------|---------------------------|-------------------------|
| Allahabad . . . . . | 6th   | 29.748"                   | + .004                  |
| Patna . . . . .     | 7th   | .667"                     | — .086                  |
| Patna . . . . .     | 8th   | .586"                     | — .167                  |
| Gya . . . . .       | 9th   | .612"                     | — .150                  |
| Patna . . . . .     | 10th  | .593"                     | — .160                  |

*2nd.—Depression of September 13th to 17th.*—This small storm was generated in the north-west angle of the Bay on the 13th, 14th and 15th, and was very feeble at sea. It crossed the North Orissa coast on the 16th, and filled up as it crossed the Orissa hill districts after giving very moderate rain to South-West Bengal and Orissa.

*3rd.—Depression of September 18th to 24th.*—Another whirl began to form in the north-west angle of the Bay on the 18th, immediately after the dispersion of the preceding small storm. It intensified slowly on the 19th, 20th and 21st, and commenced to move towards the North Orissa coast, which it crossed on the evening of the 21st. It passed rapidly through Chutia Nagpur into Central Behar, and filled up on the 24th after giving a moderate burst of rain to Behar, Chutia Nagpur, Orissa and the western districts of South-West Bengal.

*4th.—Depression of September 28th to October 3rd.*—This small storm formed in the centre of the Bay between the West Pegu coast and the coast of the Circars. It advanced to the north of west, and struck the mid-west coast of the Bay on the evening of the 29th, or morning of the 30th. It was however a very imperfectly formed cyclonic storm. The depression passed into the Deccan on the 1st of October, when it was a diffused and feeble disturbance. The centre was near and to the south of Sholapur on the 2nd. It apparently continued to advance westwards and passed over the West Ghâts into the Arabian Sea on the morning of the 3rd.

*October.*—Was the only month in the year 1886 when the mean pressure of the whole of India differed to any considerable extent from the normal. It was  $\cdot 027''$  below the normal pressure of the month, the deficiency of pressure accompanying a largish excess of temperature over the greater part of the country, due to the early termination of the rains in North and Central India. Relatively to the general conditions, pressure was in excess in the Punjab, Gangetic plain, Bengal, Assam, Orissa, and in the south of the Bay (Ceylon and in the Bay Islands).

Hence the pressure relations between different parts of the country were slightly different to what they had been during the cold weather and rains, and were gradually changing. The pressure was considerably in excess (when compared with the average condition) in the Himalayan area ( $+\cdot 024''$ ) and in Bengal ( $+\cdot 011''$ ), and was in defect in the Nerbudda valley ( $-\cdot 028''$ ), Central Provinces ( $-\cdot 020''$ ), Deccan ( $-\cdot 014''$ ), Rajputana ( $-\cdot 019''$ ), and the Madras coast ( $-\cdot 010''$ ).

The chief feature of the month was the continued existence, during the first fortnight of the month, of low pressure on the Madras coast which determined the reversion of the south-west current in the Bay, and drew the supplies of aqueous vapour brought up by the south-west monsoon current in the Bay to the Peninsula, which received moderate steady rainfall. For the same reason the month was usually free from cyclones in the Bay of Bengal.

*Depression of October 5th and 14th.*—A slight tendency to the formation of an area of low pressure, extending over the coast districts from Orissa to the Circars and the adjacent sea area, began to shew itself on the 5th, 6th, and 7th. The weather was squally near the coast, but the winds, except during the squalls, were light and unsteady. The depression developed slightly on the 9th, when it was off Vizagapatam and Masulipatam. It advanced slowly southwards; on the 11th and 12th the lowest pressure was at Masulipatam and Madras, and on the 13th at Madras and Negapatam. Hence the depression was of an entirely different character from the ordinary cyclonic storms of the month. It was rather an area of slightly deficient pressure which accompanied the reversion of the south-west monsoon current, and determined the commencement of what is popularly known as the north-east monsoon to the west coast of the Bay. The depression apparently advanced from the coast as an ill-defined cyclonic circulation across the Deccan on the 14th, and probably passed over the West Ghâts into the Arabian Sea. The disturbance gave moderate to heavy rain over the whole of Southern India.

*Depression of October 16th to 20th.*—This formed on the 17th and 18th to the west of the Andamans and marched to the W. N. W. to the coast of the Circars, which it crossed on the 19th. It was a small and comparatively feeble storm when it reached the coast. It advanced across Hyderabad on the 20th, giving moderate showers to the North Deccan and Central Provinces. It filled up on the evening of that day without crossing the West Ghâts.

The following gives the lowest observed barometric readings on each day :—

| Position.                                                                      | Date. | Hour.   | Lowest reading. |
|--------------------------------------------------------------------------------|-------|---------|-----------------|
| Ship <i>Asia</i> at Lat. $17^{\circ}$ N. and Long. $84\frac{1}{2}^{\circ}$ E.. | 18th  | 4 P.M.  | 29 $\cdot$ 350  |
| Cocanada . . . . .                                                             | 19th  | 10 A.M. | 29 $\cdot$ 690  |

*November.*—The mean pressure for the month almost exactly corresponded with the normal mean, the difference being only '001". The variations of pressure were however unusually large. This was in part due to the occurrence of two large cyclonic storms which formed near the Andamans, and advanced to the west coast of the Bay in a W. N. W. direction. The local variations of pressure were positive in Northern and Central India, and negative over the Peninsula and the centre of the Bay.

The positive variations exceeded '01" in the following districts:—

|                      |           |       |
|----------------------|-----------|-------|
| North-West Himalayas | . . . . . | '015" |
| Assam                | . . . . . | '014" |
| Konkan               | . . . . . | '014" |
| Chutia Nagpur        | . . . . . | '011" |
| North-West Provinces | . . . . . | '011" |

and the following negative variations were the largest and most important:—

|                   |           |       |
|-------------------|-----------|-------|
| East Coast.       | . . . . . | '012" |
| Central Provinces | . . . . . | '011" |

Amongst the more remarkable local variations were:—

|             |           |         |
|-------------|-----------|---------|
| Murree      | . . . . . | + '025" |
| Simla       | . . . . . | + '026" |
| Sibsagar    | . . . . . | + '023" |
| Purneah     | . . . . . | + '025" |
| Masulipatam | . . . . . | - '031" |
| Kurnool     | . . . . . | - '031" |
| Rajahmundry | . . . . . | - '027" |

Two very large depressions or cyclonic storms formed in the Bay of Bengal during the month.

*Cyclonic storm of November 2nd to November 16th.*—This storm was remarkable for its long existence, and also for its passing across the South Deccan into the Arabian Sea, to which it gave stormy weather for nearly a week. It began to form on the 1st and 2nd in the immediate neighbourhood of the Andamans and to the west of the Little Andaman Island, the most southern of the group, and on the 3rd there was a considerable depression and well marked cyclonic circulation. The centre began to move to the W. N. W., but at first very slowly. It was in lat.  $11\frac{1}{2}^{\circ}$  N. and long.  $88^{\circ}$  E. at noon of the 6th, in lat.  $12^{\circ}$  N. and long.  $86^{\circ}$  E. on the 7th, and in lat.  $12\frac{3}{4}^{\circ}$  N. and long.  $84^{\circ}$  E. on the 8th. It passed over the S.S. *Craigton* during the afternoon. Her barometer (corrected) stood at 28.40, and the wind blew with hurricane force. The cyclone had developed into one of great intensity and of considerable magnitude, the storm area in which winds exceeded force 8 being probably about 200 miles in diameter. The centre struck the Madras coast a little to the north of Madras about 2 P.M. of the 9th. Its rate of motion had gradually increased, and its velocity, just before reaching land, was between 9 and 10 miles per hour. It advanced more rapidly across the Deccan, at the rate of about 15 miles per hour, and was in lat.  $15^{\circ}$  N. and long.  $75\frac{1}{2}^{\circ}$  E. at noon on the 10th. It crossed the West Ghâts during the afternoon, and gave squally weather to the west coast on the 10th and 11th. The storm was at this stage comparatively feeble. It however continued to advance in the same direction to the W. N. W. and acquired additional energy. It passed over the P. and O. steamer *Peshawar* on the afternoon and evening of the 13th

in about lat.  $17^{\circ}$  N. and long.  $63^{\circ}$  E. Her barometer fell to  $29.24''$  at 10-30 P.M., and she experienced terrific squalls, blinding rain, and wind-squalls of hurricane force. The centre was at this time recurving to the N. W. and N. N. W. It was probably in lat.  $21\frac{1}{2}^{\circ}$  N. and long.  $60^{\circ}$  E. at noon of the 15th. It passed over the S.S. *Mobile* on the evening of the 15th in about lat.  $24^{\circ}$  N. and long.  $62^{\circ}$  E. and she suffered considerably from the force of the gale. She lost 221 horses, 3 boats, awnings, and all bulwarks were smashed more or less fore and aft. The storm had continued to recurve and was then advancing in a N. N. E. direction to the eastern portion of the Beluchistan coast. A considerable fall of the barometer occurred at Quetta and Kurrachee on the 16th, and unusually strong winds prevailed at these stations until the morning of the 17th. Hence, although there are no materials for tracing the path of the storm later than the evening of the 15th, it is certain, it did not completely break up before the evening of the 16th, or perhaps the morning of the 17th, and shortly after it reached the Beluchistan coast. It hence continued as an unbroken cyclonic circulation for at least 15 days.

The following gives data respecting the track and character of the storm :—

| Date and hour.     | PROBABLE POSITION OF STORM CENTRE. |                  | Names of Ships or Stations. | POSITION OF SHIPS OR STATIONS. |                  | Lowest barometric reading.             |
|--------------------|------------------------------------|------------------|-----------------------------|--------------------------------|------------------|----------------------------------------|
|                    | Lat. N.                            | Long. E.         |                             | Lat. N.                        | Long. E.         |                                        |

*Cyclonic storm of November 14th to 24th.*—This storm was remarkable, as it is an example of the comparatively rare class of storms which form in the Andaman Sea and pass into the Bay of Bengal. It is also very interesting as contributing to the evidence of the law that the paths of cyclones of the transition period are very largely determined by the influence and position of the land. It travelled at first parallel to the Andamans, and only adopted the normal W. N. W. course after it had advanced to the north of the Andamans and was approaching the Burmese coast. It formed slowly on the 14th, 15th and 16th to the E. S. E. of Port Blair at a distance of about

50 miles. It developed rather rapidly on the 17th and 18th, when it advanced slowly northwards to the east of the Andamans, and concentrated into a furious cyclone on the 19th. The ship *Airlie* was involved in the storm on that day and carried by it through the South Preparis Channel. Her barometer (corrected) fell to 28.72". Her log states that the cyclone blew with fearful force, the squalls were terrific, and the rain seemed to come down as a solid body. The centre passed through the South Preparis Channel on the morning of the 19th and began to recurve, so that on the 20th it was advancing in a W. N. W. direction. The storm area was of comparatively small extent, probably not more than 100 to 120 miles in diameter at any time during its existence, but within this area the cyclonic action was exceedingly violent. The centre was in lat. 16° N. and long. 90½° E. at noon of the 21st, in lat. 16½° N. and long. 87½° E. on the 22nd, and in lat. 17° N. and long. 84½° E. on the 23rd. It passed over the S. S. *Melpomene* and *Noorjehan* on the 23rd. The barometer in the *Melpomene* fell to 28.73" and she experienced the full weight of the storm as she became utterly helpless and was carried with the storm and involved in it for at least 18 hours. The storm centre struck the coast between Cocanada and Vizagapatam about midnight of the 23rd, and gave very strong winds and heavy rain to the coast districts. The storm speedily broke up under the disintegrating action and resistance of the hills, so completely that at 10 A.M. on the morning of the 24th there was no trace of cyclonic circulation on the large scale.

The following table gives data of the track of this storm :—

| Date and hour.      | PROBABLE POSITION OF STORM CENTRE. |          | Names of Ships or Stations. | POSITION OF SHIPS OR STATIONS. |                 | Lowest barometric reading. |
|---------------------|------------------------------------|----------|-----------------------------|--------------------------------|-----------------|----------------------------|
|                     | Lat. N.                            | Long. E. |                             | Lat. N.                        | Long. E.        |                            |

| " 22nd, "           | 16° 30'                            | 87° 30'  | <i>Melpomene</i> . . .      | 16° 41'                        | 86° 10'         | 28.73" at 5 and 6 P.M.     |
| " 23rd, "           | 17° 0'                             | 84° 30'  | <i>Nurjehan</i> . . .       | 16° 56'                        | 83° 56'         |                            |
| " " 2 P.M.          | 17° 0'                             | 84° 15'  | <i>Do.</i> . . .            | ...                            | ...             | 28.78" at 2 P.M.           |

The first of these storms gave a moderate burst of rain to the south and centre of the Peninsula, and the second storm was accompanied with very heavy local rainfall in the coast districts of the Circars, which will be fully described under the head of rainfall.

Fine clear weather prevailed generally until the end of the month, and the barometer oscillated within narrow limits.

*December.*—The general and local variations of the pressure for the month of December were smaller than they were for the months of September, October and November. The general variation was only +.004", and the district variations only exceeded .01" in two cases, *viz.*, Sikkim (—0.12") and the Malabar coast districts (+.012"). Hence the average distribution of pressure for the month approximated very closely to

the mean, and there were no large local peculiarities. The largest relative variations were as follows:—

|         |   |   |   |   |   |   |   |   |   |   |   |   |       |
|---------|---|---|---|---|---|---|---|---|---|---|---|---|-------|
| Leh.    | . | . | . | . | . | . | . | . | . | . | . | . | -035" |
| Kailang | . | . | . | . | . | . | . | . | . | . | . | . | -025" |
| Jhansi  | . | . | . | . | . | . | . | . | . | . | . | . | +027" |

*Depression or cyclonic storm of December 7th to 9th.*—This formed in the south of the Bay and probably in about lat.  $9^{\circ}$  N. on the 7th, after the prevalence of squally weather for several days. The centre advanced to the W. N. W., and was about 100 miles to the east of Madras at noon of the 9th. It struck the coast some distance to the north of Madras about 8 P.M. of the same day, and gradually dissipated during the next 24 hours, so that there was hardly a trace of its existence on the evening of the 10th. It was of a diffused character, and strong winds were experienced at distances of 200 to 300 miles from the centre. Thus the *Clive* had westerly winds of force 10, and hard squalls in lat.  $8\frac{1}{2}^{\circ}$  N. and long.  $82\frac{1}{4}^{\circ}$  E. on the afternoon of the 8th, when she was upwards of 250 miles from the centre.

A reference to Plate V will show the tracks of the storms that originated in the Bay of Bengal during the year.

Taking the mean anomaly of all the Indian, Ceylon and Burmese stations given in Table XVA for each month of the year, we have the following results:—

|                      | January. | February. | March. | April. | May. | June. | July. | August. | September. | October. | November. | December. | Year. |
|----------------------|----------|-----------|--------|--------|------|-------|-------|---------|------------|----------|-----------|-----------|-------|
| Number of stations . | 116      | 115       | 114    | 114    | 115  | 118   | 118   | 118     | 119        | 121      | 120       | 120       |       |
| Pressure anomalies . | -011     | +009      | -006   | +004   | -004 | -002  | -005  | -002    | +002       | -027     | -001      | +005      | -003  |

The most striking feature of the year 1886 is illustrated by the preceding numbers. The mean pressure over the whole of India was during by far the greater part of the year almost identical with the normal pressure. The anomaly for eight out of the twelve months did not exceed 005" and for only two it exceeded 010", *viz.*, January, for which it was 011", and October, for which it was 027". The abnormal conditions of the latter month, *viz.* (excessive humidity, cloud amount, and rainfall in Northern and Central India), were thus reflected in the pressure anomaly of the month.

The examination of the local variations of pressure during the year also discloses the same fact of the approximate coincidence of the actual pressure conditions of the year with the normal. The mean pressure of the year in Northern India (*i.e.*, Bengal, Assam, Behar, the North-Western Provinces, Central India, Rajputana, Sind, and the Punjab) was 002" above the average, whilst that of the remainder of India (Southern India) was 008 below the average—an illustration of the opposition between the smaller variations of meteorological conditions in Northern and Southern India.

The largest positive barometric variations for the whole year are the following:—

|            |   |   |   |   |   |   |   |   |   |   |   |   |      |
|------------|---|---|---|---|---|---|---|---|---|---|---|---|------|
| Agra       | . | . | . | . | . | . | . | . | . | . | . | . | 015" |
| Jhansi     | . | . | . | . | . | . | . | . | . | . | . | . | 025  |
| Sambalpur  | . | . | . | . | . | . | . | . | . | . | . | . | 018  |
| Hazaribagh | . | . | . | . | . | . | . | . | . | . | . | . | 012  |
| Khandwa    | . | . | . | . | . | . | . | . | . | . | . | . | 012  |

If these numbers be correct, they show that during the year there was a marked tendency to higher pressure than usual across the head of the Peninsula from Sambalpur to Eastern Rajputana.

The largest negative anomalies for the year belong to stations in the centre of the Peninsula. They are :—

|              |   |   |   |   |   |   |   |   |   |        |
|--------------|---|---|---|---|---|---|---|---|---|--------|
| Masulipatam  | . | . | . | . | . | . | . | . | . | —'022" |
| Belgaum      | . | . | . | . | . | . | . | . | . | —'016  |
| Secunderabad | . | . | . | . | . | . | . | . | . | —'013  |
| Bangalore    | . | . | . | . | . | . | . | . | . | —'013  |
| Sholapur     | . | . | . | . | . | . | . | . | . | —'013  |
| Cochin       | . | . | . | . | . | . | . | . | . | —'013  |
| Trincomalee  | . | . | . | . | . | . | . | . | . | —'012  |

The previous marks the most important persistent variations during the year. The following results show that the anomalies were even more marked before the commencement of the rains than at any other period of the year. It has been already pointed out that the pressure in April was almost exactly identical with the normal, and hence it is convenient to begin with the pressure anomalies of that month.

The following gives all the positive and negative variations (relative to the general state) for the month of April which exceed '015" :—

| Positive. |   |   |   |       | Negative. |   |   |   |       |
|-----------|---|---|---|-------|-----------|---|---|---|-------|
| Ratnagiri | . | . | . | '017" | Cuddapah  | . | . | . | '024" |
| Jhansi    | . | . | . | '017  | Kurrachee | . | . | . | '022  |
| Salem     | . | . | . | '018  | Sholapur  | . | . | . | '016  |
| Sambalpur | . | . | . | '016  | Sironcha  | . | . | . | '016  |

Of these Cuddapah is almost certainly wrong, but of the others Jhansi, Sambalpur, Sironcha are the only cases in which the variations were moderately large and the same in character as those of the whole year.

The following table gives the relative abnormal variations for the month of May exceeding '02" :—

| Positive.     |   |   |   |       | Negative. |   |   |   |       |
|---------------|---|---|---|-------|-----------|---|---|---|-------|
| Jhansi        | . | . | . | '021" | Neemuch   | . | . | . | '022" |
| Gorakhpur     | . | . | . | '037  | Indore    | . | . | . | '025  |
| Lucknow       | . | . | . | '030  | Kurrachee | . | . | . | '036  |
| Sibsagar      | . | . | . | '022  | Rajkot    | . | . | . | '032  |
| Dhubri        | . | . | . | '027  | Deesa     | . | . | . | '023  |
| Purneah       | . | . | . | '033  | Surat     | . | . | . | '026  |
| Durbhunga     | . | . | . | '029  | Bombay    | . | . | . | '031  |
| Patna         | . | . | . | '035  | Sholapur  | . | . | . | '022  |
| Hazaribagh    | . | . | . | '025  | Belgaum   | . | . | . | '038  |
| Berhampore    | . | . | . | '024  | Karwar    | . | . | . | '033  |
| Burdwan       | . | . | . | '026  | Kurnool   | . | . | . | '022  |
| Dacca         | . | . | . | '024  | Bellary   | . | . | . | '024  |
| Jessore       | . | . | . | '024  | Mangalore | . | . | . | '024  |
| Calcutta      | . | . | . | '022  | Cochin    | . | . | . | '034  |
| Saugor Island | . | . | . | '021  | Galle     | . | . | . | '029  |
| False Point   | . | . | . | '023  | Colombo   | . | . | . | '024  |
| Sambalpur     | . | . | . | '035  |           |   |   |   |       |
| Gopalpur      | . | . | . | '030  |           |   |   |   |       |

Hence the hot weather increased very considerably the abnormal features of the weather, which had been already present during the month of April. Excessive pressure became a more prominent feature in Northern and North-Eastern India, and diminished pressure in Western, Central and Southern India.

Similar characteristics are shown by the following returns for the month of June, drawn up in the same form as that for May:—

| Positive variations exceeding '02" |   |   |   |      | Negative variations exceeding '02." |   |   |   |      |
|------------------------------------|---|---|---|------|-------------------------------------|---|---|---|------|
| Peshawar                           | . | . | . | '022 | Sironcha                            | . | . | . | '032 |
| Roorkee                            | . | . | . | '021 | Masulipatam                         | . | . | . | '024 |
| Bareilly                           | . | . | . | '025 | Bellary                             | . | . | . | '027 |
| Meerut                             | . | . | . | '025 | Bangalore                           | . | . | . | '022 |
| Agra                               | . | . | . | '029 | Cochin                              | . | . | . | '028 |
| Lucknow                            | . | . | . | '026 | Coimbatore                          | . | . | . | '021 |
| Jhansi                             | . | . | . | '034 | Colombo                             | . | . | . | '024 |
| Sambalpur                          | . | . | . | '038 | Galle                               | . | . | . | '023 |
| Nowgong                            | . | . | . | '029 | Port Blair                          | . | . | . | '029 |

These figures sufficiently illustrate the more remarkable pressure variations of the year, which may be summarized as follow:—

*1st.*—Pressure was slightly in excess in Northern India, and in defect to a somewhat larger extent in Southern India.

*2nd.*—The first feature of increased pressure was most persistent and permanent at stations situated in the area that forms usually a trough of low pressure during the rains, to the south of the Gangetic valley, or at Sambalpur, Hazaribagh, Agra and Jhansi. The deficient pressure was most marked in the Deccan and the Circars, or in the area represented by the stations of Masulipatam, Secunderabad, Belgaum, Bellary and Sholapur.

*3rd.*—The characteristic features of the year, pointed out in (*1st*) and (*2nd*) were not prominent during the cold weather, or in April, but became strongly marked during the abnormally hot weather of May, and were almost as prominent in June. In other words, they were hence developed during the hot weather, and were conditions prevalent over the area invaded by the south-west monsoon current in June, and which remained more or less permanent during the monsoon, more especially the deficient pressure in the Deccan and Circars.

## WINDS.

The anemometric data consist of observations of the wind direction at 10h. and 16h. (10 A.M. and 4 P.M.) at the large majority of stations in Northern, Central and Western India and Burma; at the extra-Indian stations, Aden, Bushire, &c.; and at Mangalore, Gopalpur, Mercara, Madura, Masulipatam, Calicut, and Coimbatore, in Madras. For the Madras observatory, the directions at noon and midnight are given. At other Madras stations (except Vizagapatam), and also at Bangalore and Secunderabad, an observation at 22h. (10 P.M.) is given instead of that at 4 P.M. At Leh, Chamba, Lahore, Mussooree, Dehra, Roorkee, Lucknow, Allahabad, Dhubri, Chittagong, Calcutta, Saugor Island, Cuttack, Hazaribagh, Darjeeling, Nagpur, Pachmarhi, Jeypore, Deesa,

Ratnagiri, Belgaum, Bombay, Poona, Vizagapatam, and Rangoon, the directions are given for four diurnal periods, *viz.*, 4h.; (or 6h. in the case of Calcutta, Leh, and Bombay), 10h., 16h., and 22h.; and, at all these stations, except Vizagapatam, Allahabad, Jeypore, Leh, Chamba and Lahore, are taken from the traces of autographic instruments. At nearly all stations, the total movement of the air in 24 hours is recorded by an anemometer. At Calcutta, Madras, Rangoon, Saugor Island, Chittagong, Darjeeling, Lucknow, Roorkee, Dehra, Mussooree, Nagpur, Pachmarhi, Bombay, Belgaum, and Deesa, the instruments are large Beckley's anemographs of the Kew pattern; at Dhubri, Cuttack, Hazaribagh, Ratnagiri, and Poona Casella's embossing anemographs; and, at other stations, small anemometers with Robinson's cup and ball motors, in some cases with trains of five recording wheels, in others with two (Casella's improved pattern). A list of the elevations of the instruments at all stations was given in the Report for the year 1885.

Table IX (Appendix) gives an abstract of the wind directions, &c., for 135 stations in 1886. The abstract specifies the number of times that each of eight wind directions and calms was observed at each hour of record, and the total of each month, the trigonometrical resultant of these observations computed by Lambert's formula (an equal value being given to each observation), the mean diurnal movement of the air, and the average monthly values of the last two data, computed from as many years (exceeding two) as anemometric registers have been furnished by each station. The charts, Plates II to IV, shew these wind resultants by arrows, the lengths of which indicate the comparative excess of wind prevalence in the direction drawn on a scale such that five-eighths of an inch would represent a wind blowing continuously in the same direction throughout the month, or 100 per cent. of the observations.

*January.*—In the Punjab plains the winds were approximately normal in direction and blew more steadily than usual. They were considerably stronger than the average at the hill station of Murree. In the Gangetic plain they were generally less steady and slightly feebler than usual. Remarkably steady north winds prevailed at Lucknow, where the normal direction in January is north-west. In Central Behar and at Benares the westerly winds had a slight southerly component, instead of the usual northerly element of the season. In Bengal normal north-west land winds prevailed and were fairly steady. The westerly element was slightly more pronounced than usual, more especially in South-West Bengal.

The most important variations of the month were in the Central Provinces and Central India. Winds were very irregular in direction, indicating that the usual surface current or drift from Upper India was almost suspended or locally modified. Thus at Seoni, the average wind direction of the month was S.  $37^{\circ}$  E., the normal being N.  $75^{\circ}$  E., at Nagpur it was S.  $71^{\circ}$  E. as compared with N.  $72^{\circ}$  E., at Khandwa S.  $73^{\circ}$  E. instead of N.  $25^{\circ}$  E., and at Amraoti S.  $64^{\circ}$  E. instead of N.  $70^{\circ}$  E. The same kind of irregularity, but to a smaller extent, is shewn by the wind observations in Rajputana and Central India. At Bickaneer the mean wind direction was S.  $12^{\circ}$  E., the normal being N.  $62^{\circ}$  E. and at Mount Abu S.  $69^{\circ}$  W., the normal being N.  $83^{\circ}$  W. On the Bombay coast the northerly winds contained a much stronger easterly element than usual. Thus, for example, at Ratnagiri the mean wind direction was N.  $35^{\circ}$  E. instead of N.  $34^{\circ}$  W., and at Bombay N.  $12^{\circ}$  E. instead of N.  $6^{\circ}$  E.

In Southern India the winds were almost normal in direction, and as steady as usual, but their velocity was much below the average, as is seen by the following :—

|                      | Daily wind velocity,<br>January 1886. | Normal daily wind<br>velocity, January. |
|----------------------|---------------------------------------|-----------------------------------------|
| Madura . . . . .     | 79                                    | 132                                     |
| Negapatam . . . . .  | 98                                    | 130                                     |
| Coimbatore . . . . . | 59                                    | 75                                      |
| Salem . . . . .      | 84                                    | 124                                     |
| Madras . . . . .     | 130                                   | 149                                     |

They were approximately normal in Burma, but feeble at Port Blair in the Andamans, where the average wind direction was N.  $76^{\circ}$  E., instead of S.  $87^{\circ}$  E.

*February.*—Very steady north-west winds prevailed during the month in the Punjab and the Gangetic plain. They were also stronger than usual, more especially at Delhi, Ludhiana, Dera Ismail Khan and Sirsa, and in the Gangetic Doab, South Behar and Chutia Nagpur. At several stations, as for example Gya, Allahabad, Agra, Delhi, the average daily air motion was nearly twice as large as usual. In Rajputana, Central India, and the Central Provinces, north-west winds of unusual steadiness and strength prevailed. The following examples illustrate the remarkable steadiness of the cool winds of the month in Northern and Central India :—

| STATIONS.            | STEADINESS.                     |                                  |
|----------------------|---------------------------------|----------------------------------|
|                      | Percentage, Febru-<br>ary 1886. | Average percentage,<br>February. |
| Delhi . . . . .      | 67                              | 39                               |
| Roorkee . . . . .    | 66                              | 23                               |
| Agra . . . . .       | 74                              | 38                               |
| Lucknow . . . . .    | 92                              | 44                               |
| Patna . . . . .      | 72                              | 47                               |
| Hazaribagh . . . . . | 79                              | 60                               |
| Burdwan . . . . .    | 65                              | 43                               |
| Calcutta . . . . .   | 55                              | 23                               |
| Sambalpur . . . . .  | 45                              | 19                               |
| Nagpur . . . . .     | 49                              | 17                               |
| Sutna . . . . .      | 64                              | 38                               |
| Nowgong . . . . .    | 48                              | 29                               |
| Jeypore . . . . .    | 59                              | 37                               |

In Western India, as far south as Bombay, the effect of the pronounced cold weather conditions was to give an unusual amount of easterly to the northerly winds. The

result is shewn in the mean wind direction of every station. The following are a few examples:—

| STATIONS.           | Mean wind direction,<br>February 1886. | Normal mean wind<br>direction, February. |
|---------------------|----------------------------------------|------------------------------------------|
| Hyderabad . . . . . | N. 8° E.                               | N. 31° W.                                |
| Kurrachee . . . . . | N. 13° E.                              | N. 61° W.                                |
| Bhuj . . . . .      | N. 22° E.                              | N. 7° E.                                 |
| Deesa . . . . .     | N. 21° E.                              | N. 28° W.                                |
| Surat . . . . .     | N. 33° E.                              | N. 10° W.                                |
| Malegaon . . . . .  | N. 34° E.                              | N. 6° E.                                 |
| Bombay . . . . .    | N. 5° E.                               | N. 4° W.                                 |

The winds in this part of India were characterized by the same unusual steadiness as in Northern India. For example, at Surat the percentage expressing their steadiness was 55, the normal being 30, and at Malegaon it was 37, the normal being 17.

In the Deccan and Southern India, winds were also steadier and generally approximately normal in direction. In the more southern districts the north-east winds were much feebler than usual. The following means illustrate this feature:—

| STATIONS.           | Daily wind velocity,<br>February 1886. | Normal daily wind<br>velocity, February. |
|---------------------|----------------------------------------|------------------------------------------|
| Salem . . . . .     | 91                                     | 137                                      |
| Negapatam . . . . . | 73                                     | 83                                       |
| Madura . . . . .    | 95                                     | 121                                      |

In Burma (with the exception of Arakan) winds were slightly feebler and less steady, and probably also at Port Blair, but the variations were small compared with those of Upper India.

*March.*—Was a month of storms and unsettled weather as contrasted with February, in which the weather was unusually fine and cool and skies clear. The air movement was hence marked by features the opposite of those of the preceding month. Winds were very variable and unsteady in Northern India, and in the majority of cases feebler, more especially in the Punjab and at the foot of the hills in the North-West Provinces. The following table gives the percentage of steadiness at the more important stations in Northern and Central India for comparison with the similar return given for the month of February:—

| STATIONS.            | STEADINESS.                |                               |
|----------------------|----------------------------|-------------------------------|
|                      | Percentage, March<br>1886. | Average percentage,<br>March. |
| Rawalpindi . . . . . | 13                         | 24                            |
| Sialkot . . . . .    | 10                         | 34                            |
| Delhi . . . . .      | 12                         | 47                            |
| Rooke . . . . .      | 11                         | 23                            |
| Agra . . . . .       | 16                         | 39                            |
| Bareilly . . . . .   | 28                         | 44                            |
| Patna . . . . .      | 35                         | 48                            |
| Hazaribagh . . . . . | 40                         | 61                            |

The disturbed conditions of the month in the interior gave slightly steadier and stronger sea (or south-west) winds in Bengal. The percentage of steadiness at Calcutta was 52, or 3 above the average. The average daily wind velocity at Saugor Island was 320·8 miles, the normal average being 289·2 miles.

In Sind, Rajputana, Central India and Guzerat the air motion generally presented the same abnormal features as in Upper India. Winds were light and very variable, but their mean directions deviated very slightly from the normal. South-east shore winds blew with unusual steadiness across the Coromandel coast, and were in some cases stronger than usual. The percentage at Negapatam for the month was 83, or 13 above the average, and at Salem 88, or 54 above the average. The winds were normal in direction and of average strength in Burma.

*April.*—Ordinary hot weather conditions prevailed during the month, which was very free from disturbance. Hence normal dry hot westerly and north-westerly winds blew throughout the month in Northern and Central India. They were characterized by great steadiness. The following gives data illustrating this feature for several stations:—

| STATIONS.            | STEADINESS.             |                            |
|----------------------|-------------------------|----------------------------|
|                      | Percentage, April 1886. | Average percentage, April. |
| Ludhiana . . . . .   | 49                      | 27                         |
| Roorkee . . . . .    | 38                      | 10                         |
| Agra . . . . .       | 66                      | 44                         |
| Lucknow . . . . .    | 55                      | 44                         |
| Jhansi . . . . .     | 48                      | 28                         |
| Allahabad . . . . .  | 49                      | 25                         |
| Patna . . . . .      | 37                      | 27                         |
| Sambalpur . . . . .  | 57                      | 40                         |
| Nagpur . . . . .     | 38                      | 20                         |
| Jubbulpore . . . . . | 42                      | 32                         |

They were in many cases, more especially at Allahabad, Bareilly, Lucknow, and probably over the whole of the central and eastern districts of the North-West Provinces, from 15 to 30 per cent. stronger than the normal winds of the month.

At all the hill stations in Northern India the winds were steadier and slightly stronger and blew more directly from the south than usual.

|                      | Mean wind direction, April 1886. | Normal mean wind direction, April. |
|----------------------|----------------------------------|------------------------------------|
| Simla . . . . .      | S. 3° E.                         | S. 61° W.                          |
| Chakrata . . . . .   | S. 44° W.                        | S. 68° W.                          |
| Ranikhet . . . . .   | S. 51° W.                        | S. 62° W.                          |
| Darjeeling . . . . . | S. 45° W.                        | S. 65° W.                          |

In Bengal, on the other hand, the southerly winds had more westing than usual, which was probably caused mainly (or as part of the same general action) by the increased

strength of the north-westerly winds and westerly in the eastern districts of the North-West Provinces, Behar and Chutia Nagpur.

The following table gives data in illustration :—

| STATIONS.          | DIRECTION.                       |                                    |
|--------------------|----------------------------------|------------------------------------|
|                    | Mean wind direction, April 1886. | Normal mean wind direction, April. |
| Jessore . . . . .  | S. 21° W.                        | S. 11° W.                          |
| Dacca . . . . .    | S. 7° W.                         | S. 4° E.                           |
| Calcutta . . . . . | S. 29° W.                        | S. 3° W.                           |
| Cuttack . . . . .  | S. 23° W.                        | S. 17° W.                          |

The average air motion at Saugor Island for the month was 482 miles per diem, or 82 miles above the average.

In Southern India the winds were feebler and less steady than usual. They were abnormally unsteady and variable at Bellary, and at one or two other stations in the Deccan. This was also the case at Port Blair in the Andamans. Normal winds prevailed in Burma during the month.

*May.*—The local winds at the head of the Bay blew more steadily and directly into Bengal than usual, as is shewn by the following :—

|                    | Percentage, May 1886. | Average percentage, May. | Mean wind direction, May 1886. | Normal mean wind direction, May. |
|--------------------|-----------------------|--------------------------|--------------------------------|----------------------------------|
| Dacca . . . . .    | 46                    | 60                       | S. 2° W.                       | S. 19° E.                        |
| Jessore . . . . .  | 66                    | 61                       | S. 10° W.                      | S. 10° E.                        |
| Calcutta . . . . . | 69                    | 66                       | S. 2° W.                       | S. 11° E.                        |

These sea winds extended during the month much further into the interior than usual, and very considerably modified the mean wind directions over the greater part of the Gangetic plain. In Behar, which is usually the limit of these winds in May, they prevailed with much greater steadiness than usual. On the other hand, in the western districts of the North-West Provinces the winds were from the same cause abnormally unsteady. The following data illustrate the preceding facts :—

| STATIONS.            | STEADINESS.           |                          | DIRECTION.                     |                                  |
|----------------------|-----------------------|--------------------------|--------------------------------|----------------------------------|
|                      | Percentage, May 1886. | Average percentage, May. | Mean wind direction, May 1886. | Normal mean wind direction, May. |
| Hazaribagh . . . . . | 29                    | 15                       | S. 9° E.                       | S. 77° W.                        |
| Gya . . . . .        | 48                    | 28                       | N. 10° E.                      | N. 17° E.                        |
| Patna . . . . .      | 71                    | 38                       | N. 59° E.                      | N. 54° E.                        |

| Lucknow . . . . .    | 23                    | 15                       | S. 77° W.                      | N. 15° E.                        |
| Agra . . . . .       | 7                     | 30                       | S. 86° W.                      | N. 72° W.                        |
| Bareilly . . . . .   | 28                    | 2                        | S. 37° E.                      | N. 66° W.                        |
| Meerut . . . . .     | 21                    | 24                       | S. 37° E.                      | N. 32° W.                        |
| Delhi . . . . .      | 17                    | 12                       | S. 81° E.                      | N. 49° W.                        |

In fact, during the greater part of the month, abnormal east and south-east winds prevailed in the North-West Provinces and the eastern districts of the Punjab, instead of the dry north-west land-winds proper to the season.

In Central India and Rajputana the winds were normal in direction and intensity, but, further south, in the Central Provinces they were somewhat variable as compared with ordinary years, and the mean wind direction at stations in the eastern districts shifted in some cases from the north of west to the south of it. Thus :—

| STATIONS.          | STEADINESS.           |                          | DIRECTION.                     |                                  |
|--------------------|-----------------------|--------------------------|--------------------------------|----------------------------------|
|                    | Percentage, May 1886. | Average percentage, May. | Mean wind direction, May 1886. | Normal mean wind direction, May. |
| Nagpur . . . .     | 18                    | 44                       | S. 52° W.                      | N. 41° W.                        |
| Jubbulpore . . . . | 35                    | 44                       | S. 76° W.                      | N. 62° W.                        |
| Khandwa . . . .    | 42                    | 69                       | N. 57° W.                      | N. 61° W.                        |
| Amraoti . . . .    | 29                    | 52                       | N. 53° W.                      | N. 51° W.                        |

On the Bombay coast and in the Deccan, winds were quite up to their average strength. But there was the same unusual predominance of the southerly element in the westerly winds at Bombay, Poona, Sholapur, Secunderabad, Bellary, as at Nagpur and Jubbulpore in the Central Provinces. The winds were also much less steady than usual.

In Madras and Southern India generally, Ceylon, and also Burma, the variations were small and of no apparent importance. The mean wind direction at Port Blair was S. 16° E. (the normal being S. 38° W.), and at Nancowry S. (the normal being S. 43° W.), thus shewing that the south-west winds of the summer monsoon were either later in advancing up the south of the Bay than usual, or that there was more irregular cyclonic action and squally weather during the earlier uprushes of the humid south-west monsoon current.

*June.*—Over the greater part of India the normal monsoon seasonal winds prevailed. They were, although on the whole even steadier than usual, considerably below their normal strength. This latter feature was, as might be expected, more strongly marked in the winds of the interior (the Central Provinces, Deccan and Central India) than in those of the west coast. The following table shews how much the Bombay current was below its normal strength :—

| STATIONS.             | VELOCITY.                       |                                   | Defect expressed as a percentage. |

So far as the preceding anemometric returns can be relied upon, they certainly appear to shew that the Bombay current was nearly up to its average strength in some parts of the Malabar coast, but was considerably below it on the Bombay coast and near its northern limits in Guzerat and Sind, and that over the whole of the Deccan and Central India it was much less powerful than usual. This deficiency of strength was more marked in Central India than the Deccan. The current in the south of the Bay was also weaker as shewn by the wind observations at Nancowry and Port Blair. It was slightly below its average strength at the head of the Bay, but winds were much steadier than usual in Behar and to a less extent in Bengal. Its influence in Upper India was less regular and powerful and more intermittent than usual, and hence the winds were remarkably unsteady in some cases, and the wind directions shewed large variations from the normal.

The following examples illustrate these features of the air motion in Upper India :—

| STATIONS.         | STEADINESS.            |                           | DIRECTION.                      |                                   |

The winds in Burma were approximately normal, and presented, so far as can be judged from the observations, some of which are very doubtful, no large or important variations from the normal.

*July.*—The south-west monsoon winds are usually steadiest and strongest in July. They were in July 1886 on the average very considerably below their normal strength at Port Blair and Nancowry, the daily amount of wind being barely 50 per cent. of the mean July amount. They were also weak in Pegu, but at the head of the Bay they were on the contrary stronger than usual, an illustration of the large amount of variation that there may be in the horizontal velocity at different parts of the same great atmospheric current. In South Bengal the easterly element in the southerly winds was slightly less prominent than usual. At Allahabad and Benares and in South Behar winds were even more variable than usual, and there was, as shewn by the wind directions in the eastern districts of the North-West Provinces and Bundelkhand, much irregular cyclonic motion. In Upper India the easterly and south-easterly winds were unusually steady, as is shewn by the following examples :—

|                    | Percentage, July 1886. | Average percentage, July. |
|--------------------|------------------------|---------------------------|
| Lucknow . . . . .  | 41                     | 18                        |
| Agra . . . . .     | 28                     | 13                        |
| Bareilly . . . . . | 48                     | 31                        |
| Delhi . . . . .    | 28                     | 15                        |
| Rawalpindi . . . . | 54                     | 35                        |

The same abnormal steadiness characterized the winds at the hill stations and also in the Assam valley. On the west coast winds were even steadier than is usual, but the wind velocity was considerably below the average, apparently an early indication of the general weakness and early retreat of the Bombay current. The above features are shewn by the following returns:—

| STATIONS.         | STEADINESS.            |                           | VELOCITY.                            |                                   |
|-------------------|------------------------|---------------------------|--------------------------------------|-----------------------------------|
|                   | Percentage, July 1886. | Average percentage, July. | Mean daily wind velocity, July 1886. | Normal daily wind velocity, July. |
| Surat . . . .     | 90                     | 83                        | ?                                    | ?                                 |
| Bombay . . . .    | 94                     | 83                        | 406                                  | 455                               |

| Ratnagiri . . . . | 72                     | 77                        | 251                                  | 319                               |
| Belgaum . . . .   | 93                     | 90                        | 550                                  | 664                               |

The winds were even more deficient in strength in the more southern districts of Madras, and in the majority of cases were less steady than usual:—

| STATIONS.           | STEADINESS.            |                           | VELOCITY.                            |                                   |

| Bellary . . . .     | 85                     | 88                        | 269                                  | 300                               |
| Madras . . . .      | 62                     | 65                        | 137                                  | 198                               |
| Madura . . . .      | 42                     | 86                        | 58                                   | 111                               |
| Coimbatore . . . .  | 83                     | 84                        | 139                                  | 198                               |
| Mangalore . . . .   | 52                     | 60                        | 71                                   | 78                                |

The preceding facts hence seem to indicate that both branches of the great monsoon current blew less strongly, but more steadily, during the month than usual. In their chief meeting ground, the south-eastern districts of the North-West Provinces and in Bundelkand, the winds were hence more variable than usual, but in Upper India they blew far more steadily than is usual up to the most northern districts of the Punjab.

*August.*—The abnormal features of the air movement during the month of August were generally identical in character with those of July. Winds were very weak at Port Blair and Nancowry, and also to a less extent in Pegu. In South Bengal they were of normal strength, but the easterly element was much weaker than usual and was in some cases replaced by a slight westerly component, as is shewn by the following:—

|                    | Mean wind direction, August 1886. | Normal mean wind direction, August. |
|--------------------|-----------------------------------|-------------------------------------|
|                    |                                   |                                     |
| Burdwan . . . . .  | S. 13° E.                         | S. 30° E.                           |
| Calcutta . . . . . | S. 2° E.                          | S. 17° E.                           |
| Jessore . . . . .  | S. 2° W.                          | S. 20° E.                           |
| Dacca . . . . .    | S. 4° W.                          | S. 14° E.                           |

In the eastern districts of the North-West Provinces, westerly winds, the continuation of the current across the head of the Peninsula, blew with much greater steadiness than the easterly winds they replaced. The following data illustrate this feature:—

| STATIONS.           | STEADINESS.              |                             | DIRECTION.                        |                                     |
|---------------------|--------------------------|-----------------------------|-----------------------------------|-------------------------------------|
|                     | Percentage, August 1886. | Average percentage, August. | Mean wind direction, August 1886. | Normal mean wind direction, August. |
| Benares . . . . .   | 23                       | 11                          | S. 66° W.                         | S. 49° E.                           |
| Allahabad . . . . . | 16                       | 4                           | S. 70° W.                         | N. 40° E.                           |
| Agra . . . . .      | 30                       | 10                          | S. 87° W.                         | S. 22° E.                           |

In Upper India winds were approximately normal in direction except at the foot of the hills, where they were very variable and feeble.

| STATIONS.          | STEADINESS.              |                             | VELOCITY.                              |                                   |

| Sialkot . . . . .  | 40                       | 28                          | 21                                     | 52                                |

Winds on the west coast were unchanged in character. They were slightly steadier than usual, but were very considerably below their normal strength. In the southern districts of Madras they were very variable and irregular. The following table gives information for several stations as in the preceding month:—

| STATIONS.            | STEADINESS.              |                             | VELOCITY.                              |                                     |

| Madura . . . . .     | 40                       | 86                          | 44                                     | 90                                  |

The wind observations for the month indicate that the Bombay current blew more directly across the head of the Peninsula than in ordinary years, and hence gave steadier winds than usual in Bundelkhand, Allahabad and Benares. The same action caused the winds in Upper India to be lighter and more irregular in direction, more especially in the neighbourhood of the hills. The Bengal current was not so strong relatively to the normal as the Bombay current, and the winds in Bengal and at the head of the Bay under the pressure of the current from the west coast had a much smaller tendency to deflect to the west up the Gangetic Valley, and hence blew more directly into East Bengal than usual.

*September.*—Winds were slightly steadier than usual at the Bay Islands and on the north and east coasts of the Bay. They were also very steady in Bengal and Behar, and fairly normal in direction. Over the whole of Upper and Central India, in consequence of the cessation of the rains in the first week of the month, dry north-westerly land-winds set in unusually early, and blew with great steadiness during the remainder of the month. They extended over the Punjab, Rajputana, Central India, the North-West Provinces and the greater part of the Central Provinces.

The following table gives data in illustration:—

| STATIONS.           | STEADINESS.                 |                                | DIRECTION.                           |                                        |
|---------------------|-----------------------------|--------------------------------|--------------------------------------|----------------------------------------|

The winds were less steady on the Bombay coast, and their mean direction had a feeble northerly element in place of the normal southerly element.

On the Malabar coast and in Southern India the air motion was generally normal in character, except locally at Vizagapatam and Madura, where winds were apparently very weak in comparison with the normal winds of the month.

The chief feature of the month was hence the unusual weakness of the Bombay current, more especially near its upper northern limits, which was chiefly shewn by its early permanent retreat from Upper India in the first week of the month, and the subsequent prevalence of dry north-west land-winds. The Bengal current blew with considerable steadiness and strength, but did not penetrate beyond Behar and the eastern districts of the North-West Provinces.

*October.*—The weather in October was very abnormal in consequence of the unusual character and position of the depressions which formed near the west coast of the Bay. These cyclonic circulations were antagonistic to the prevalence of north-west winds in Northern India, and the damp easterly winds in their northern quadrants carried an unusual

amount of moisture into Bengal and Behar, and were continued up the Gangetic valley as light easterly winds. The winds in Upper India were hence unusually variable during the month, and the mean wind directions present an easterly instead of a westerly element in the great majority of cases, as is shewn by the results in the following table :—

| STATIONS.          | STEADINESS.               |                              | DIRECTION.                         |                                      |
|--------------------|---------------------------|------------------------------|------------------------------------|--------------------------------------|

| Nowgong . . . . .  | 14                        | 35                           | N. 3° W.                           | N. 42° W.                            |
| Ajmere . . . . .   | 25                        | 23                           | N. 61° E.                          | N. 76° W.                            |

The winds were, from the same meteorological conditions, much steadier in Bengal and Behar :—

|                    | Percentage, October 1886. | Average percentage, October. |
|--------------------|---------------------------|------------------------------|
| Patna . . . . .    | 10                        | 4                            |
| Gya . . . . .      | 40                        | 4                            |
| Calcutta . . . . . | 21                        | 11                           |

The almost continuous succession of feeble depressions in the Bay also caused the winds at Port Blair and Nancowry and in Pegu and Arakan to be much steadier than usual, as is shewn by the following :—

| STATIONS.            | STEADINESS.               |                              | DIRECTION.                         |                                      |
|----------------------|---------------------------|------------------------------|------------------------------------|--------------------------------------|
|                      | Percentage, October 1886. | Average percentage, October. | Mean wind direction, October 1886. | Normal mean wind direction, October. |
| Diamond Island . . . | 57                        | 18                           | S. 81° E.                          | S. 49° E.                            |
| Port Blair . . . . . | 32                        | 24                           | S. 50° W.                          | S. 5° W.                             |
| Nancowry . . . . .   | 79                        | 53                           | S. 26° W.                          | S. 39° W.                            |

Winds on the other hand were very light and unsteady in the Bombay coast districts and the Deccan, but in the most southerly districts of the Peninsula they were, as in the east and south-east of the Bay, much less variable than usual. The following data shew the variability and unsteadiness of the winds in Bombay :—

| STATIONS.            | STEADINESS.               |                              | DIRECTION.                         |                                      |
|----------------------|---------------------------|------------------------------|------------------------------------|--------------------------------------|
|                      | Percentage, October 1886. | Average percentage, October. | Mean wind direction, October 1886. | Normal mean wind direction, October. |
| Bombay . . . . .     | 13                        | 38                           | S. 55° E.                          | N. 15° E.                            |
| Belgaum . . . . .    | 35                        | 72                           | S. 58° W.                          | N. 88° E.                            |
| Secunderabad . . . . | 11                        | 44                           | N. 23° W.                          | N. 30° E.                            |

*November.*—The weather in the Bay was much disturbed during the month, and cyclonic winds prevailed to an unusual extent over it and the adjacent coast districts.

Hence the winds in Bengal were stronger and steadier than is usual in November, and contained a much stronger easterly component than usual. The abnormal prevalence of north-easterly and easterly winds in Bengal and Behar was accompanied by light and unsteady north-west winds in Upper India. For example,—

|                     | Percentage,<br>November 1886. | Average percentage,<br>November. |
|---------------------|-------------------------------|----------------------------------|
| Lahore . . . . .    | 4                             | 22                               |
| Delhi . . . . .     | 27                            | 50                               |
| Roorkee . . . . .   | 12                            | 28                               |
| Bareilly . . . . .  | 33                            | 42                               |
| Allahabad . . . . . | 12                            | 21                               |
| Benares . . . . .   | 15                            | 42                               |

In the Central Provinces and Central India, and over nearly the whole of the Deccan and Madras, winds were normal in direction and intensity. On the Bombay coast they were slightly steadier, and at both Bombay and Ratnagiri they had a feeble and unusual easterly element. In Arakan and Pegu they were very steady, and over the east and south of the Bay the air motion was above the average.

*December.*—A small cyclonic storm gave abnormal winds in Southern India and the Deccan during the first week of the month, but afterwards ordinary cold weather winds prevailed over the whole country. Winds were generally steadier than usual in Upper India. In Bengal they were less steady, and an abnormal feature presented itself, *viz.*, the unusual strength of the westerly element of the cold weather winds in Bengal, as is shewn by the following:—

|                    | Mean wind direction,<br>December 1886. | Normal mean wind<br>direction, December. |
|--------------------|----------------------------------------|------------------------------------------|
| Jessore . . . . .  | N. 35° W.                              | N. 13° W.                                |
| Calcutta . . . . . | N. 26° W.                              | N. 26° W.                                |
| Dacca . . . . .    | N. 70° W.                              | N. 36° W.                                |

This marked extension of dry north-westerly winds into the more eastern districts of East Bengal became a prominent feature of the early months of 1887.

Over nearly the whole of the Peninsula, and also in Burma and at the Bay Islands, winds were practically normal in direction and strength. The only marked exception was in the Bombay coast districts and the Bombay Deccan, where the winds shewed in some cases the same abnormal features as in the month of November. This is illustrated by the following data:—

| STATIONS.           | STEADINESS.                   |                                  | DIRECTION.                               |                                          |
|---------------------|-------------------------------|----------------------------------|------------------------------------------|------------------------------------------|

| Bellary . . . . .   | 52                            | 72                               | S. 75° E.                                | S. 85° E.                                |
| Belgaum . . . . .   | 57                            | 70                               | N. 76° E.                                | S. 87° E.                                |
| Ratnagiri . . . . . | 42                            | 36                               | N. 14° E.                                | N. 4° W.                                 |

The preceding discussion has shewn that there were many striking variations in the lower air motion over India during the year 1886. Winds were more variable and less steady in the months of January and March than usual, but this was mainly due to the occurrence of a large number of cold-weather storms. During the months of February and April, when the weather stood in marked contrast to that of the months of January and March in the almost entire absence of atmospheric disturbance, the winds in Northern India were remarkably and abnormally steady and generally stronger than usual. The intense heat and dryness of April was followed by an unusually strong influx of sea-winds from the head of the Bay across Bengal into Behar, and along the foot of the hills into Upper India. In Central India and the Central Provinces the ordinary winds of the month prevailed. The months of May and June introduced the larger circulation of the south-west monsoon current. The conditions in the land area, so far as they were indicated by distribution of pressure, temperature and winds, were very approximately normal over the whole area except Bengal and Behar and the submontane districts of North-Eastern India. Nevertheless the circulation was much weaker than usual. This was especially marked in the case of the Bombay current. It gave feebler winds than usual, more especially near its northern limits, in the months of June, July and August. It was somewhat late in being established in the Bombay coast. It retreated from the Punjab, Rajputana, Central India, and the Central Provinces unusually early, in the first week of September, and gradually contracted southwards during that month and in October, during which time it gave very feeble winds on the Malabar coast and the Bombay Deccan districts. The conditions and phenomena seem to point rather to abnormal conditions over the sea area than in India itself, but this is a point which can only be conjectured in the absence of meteorological information from the Arabian Sea and North Indian Ocean.

The Bengal current appears also to have been weaker than usual, and probably from the same abnormal conditions over the oceanic area to the south of India. It gave abundant rain to the whole of Bengal during the south-west monsoon proper. During the months of October and November and the first fortnight of December a succession of depressions formed in the Bay and passed over or into the Peninsula. Those formed in October were of feeble intensity and diffused in character, and hence distributed rainfall over the greater part of the Peninsula. Those of November and December were concentrated cyclones which gave heavy or excessive rain to the areas over which they passed. This frequent repetition of storms in the Bay is generally an indication of the weakness of the south-west monsoon current and of abnormal conditions in the Bay. After the disappearance of the last storm of the year in the second week of December, cold-weather conditions were established over the whole of India, and the winds assumed their usual cold-weather directions and character.

## HYGROMETRY.

The hygrometric data for the year are given in Tables X, XI and XII of the Appendix. The first of these gives the monthly means of the readings of the wet-bulb thermometer at each hour of observation, of the minimum wet-bulb, the mean range, and the adopted mean wet-bulb temperature of each month (which, in nearly all cases, is the average of the 10h., 16h., and minimum readings), and the difference of these several values and the corresponding air temperatures. The mode of exposure adopted for the hygrometers has been already described in the section on air temperature, and is such that the wet-bulb is freely exposed to the wind. This is an essential condition; and when a gentle or even moderately strong breeze is blowing, it has been found that the temperature of the wet-bulb thermometer approximates very closely to that assumed in Regnault's hygrometric formula; but in a perfectly calm state of the atmosphere, the vapour which is given off from the wet-bulb is not removed with sufficient rapidity, and the temperature marked is somewhat too high. The free exposure of the thermometer, under an open shed, reduces this cause of error to a minimum; but at certain seasons of the year, and at certain stations, it probably still affects the readings to some small extent.

The second table (XI of the Appendix) shews the mean vapour tensions of the several months, the monthly means of observation for the two hours (10 A.M. and 4 P.M.) and those deduced from the readings of the minimum dry and wet-bulbs; and the third table (XII of Appendix) gives the mean relative humidities similarly obtained. In all cases, including the Ceylon stations, the hygrometric data are taken from the tables accompanying the *Vade Mecum*, which are computed to the vapour tension of lat.  $22^{\circ}$ , by means of Regnault's modification of August's formula. In these, a constant barometric pressure is assumed for the same station, *viz.*, 29.7 inches for stations up to 1,000 feet elevation, 27.7 inches for stations between 1,000 and 3,000 feet, 25.8 inches for those between 3,000 feet and 5,000 feet, 23.5 inches for the hill stations of the Nilgiris and the Himalayas, all of which are between 6,000 and 8,000 feet, and 19.7 inches for the hill stations of Leh and Kailang, which are at elevations of between 10,000 and 11,500 feet.

The four tables which follow (Tables XIX to XXII), shew the average vapour tension and relative humidity at 124 stations in India, Burma, &c., computed from as many years as have yielded comparable data, and the differences of these averages and those of the year 1886. In these tables of averages there have been included only two classes of data, namely, those deduced from the 10h., 16h., and minimum readings, and those formerly recorded at six-hourly intervals at certain stations. The difference of the results obtained by these two methods is insufficient seriously to affect the general validity of the averages; and they may be used as a fair approximation for the purpose of comparison until such time as a discussion of the hourly observations, recorded for some years past at several of the leading stations, shall afford the means of correcting the whole, more accurately, to a common standard.

In the case of the Ceylon stations, the averages given are those of the observations of 9h. 30m. and 15h. 30m. only.

Tables XXIII and XXIV give a geographical summary of the data of Tables XXI and XXII, on a plan similar to that adopted in the cases of Tables XIII and XVI, in previous sections of this report.

TABLE XIX.—Average monthly mean vapour tension of 124 stations in India, Ceylon, &amp;c.

| STATIONS.          | Years. | January. | February. | March. | April. | May. | June. | July. | August. | September. | October. | November. | December. | Year. |

*January.*—The humidity of the atmosphere was above the average over the whole of India, except Assam and the Bay Islands. It was relatively and absolutely most in excess in the Punjab, North-Western Provinces and Eastern Rajputana, and to a nearly equal extent in the Malabar and Carnatic coast districts, the Deccan and Ceylon. The excess was absolutely greatest in the South-East Punjab at Lahore and Ludhiana. The relative humidity in the North-West Himalayas was also above the normal, but not quite to the same extent as in the plains, and the excess there was almost entirely due to the unusually low temperature which prevailed during the month in that region. There was also a moderate excess absolutely and relatively in Behar, Chutia Nagpur, and the Central Provinces. In Bengal, Orissa, Assam and the Eastern Peninsula, the variations were small.

*February.*—was drier than usual over almost the whole of India, and the differences between the actual and normal values were as marked in the values of the mean vapour pressure as in those of the relative humidity. The humidity was slightly in excess in the Himalayan districts, but this was mainly due to the temperature being lower than is usual in February. There was also a moderate excess in the amount of vapour in the air in the

Coromandel coast districts, and Tenasserim, and also, but to a much less extent, in the Bay Islands. Over the remainder of the Indian area the air was drier than usual. The deficiency was most marked in Bengal, Orissa, Behar, the North-Western Provinces, Rajputana and Sind, and diminished in amount southwards. The variations differed very considerably from station to station, more especially in North-Western India. The largest local variation occurred at Kurrachee, where the winds were much more directly from the dry interior of Beluchistan than usual. The relative humidity at that station was only 35 or 21 less than the normal (56). The relative humidity and the vapour tension were slightly below the average in the Bombay and Malabar coast districts; there was a moderate deficiency in the Central Provinces, and a slight deficiency on the whole but accompanied with great irregularity, in the Deccan, Southern India and Ceylon. Thus there was a small area represented by Coimbatore and Salem, in which the relative humidity was 69 per cent. or 14 per cent. above the normal (55). If the Masulipatam observations can be accepted, there was a very large deficiency (of 15 per cent.) in the humidity of that station.

*March.*—The month of March was characterized, on the whole, by greater humidity than usual in Northern India, and by normal or decreased humidity in Southern India. There was a very large excess in the North-West Himalayas and the Punjab, and also perhaps locally in South Behar and Chutia Nagpur. The humidity observations at Gya, upon which the figures giving the hygrometric condition of South Behar depend, were at this period very doubtful, and it is more probable that the excess was moderate, and intermediate between that in the North-Western Provinces and Bengal. The excessive humidity was greatest locally at Lahore in the Punjab plains. The relative humidity was in excess by small amounts over North-Eastern India, and the Eastern Peninsula, but there were local exceptions as at Patna, Dacca and the coast stations of False Point and Saugor Island.

*April*—was a dry month. The humidity was both absolutely and relatively below the average over the whole Indian area, except the Carnatic and Malabar coasts, the Bay Islands, and Tenasserim. The lowest humidities were registered in the Central Provinces, Central India, Rajputana, and the adjacent districts of the North-Western Provinces, including Agra and Jhansi. The following gives the lowest average monthly humidities :—

|                       |    |                    |    |
|-----------------------|----|--------------------|----|
| Agra . . . . .        | 27 | Neemuch . . . . .  | 20 |
| Jhansi . . . . .      | 23 | Sutna . . . . .    | 19 |
| Nagpur . . . . .      | 19 | Indore . . . . .   | 18 |
| Jubbulpore . . . . .  | 23 | Jeypore . . . . .  | 26 |
| Hoshangabad . . . . . | 22 | Sambhar . . . . .  | 23 |
| Chikalda . . . . .    | 21 | Mt. Abu . . . . .  | 23 |
| Akola . . . . .       | 19 | Deesa . . . . .    | 25 |
| Amraoti . . . . .     | 17 | Sholapur . . . . . | 25 |

The deficiency in the relative humidity was greatest in the Central Provinces, the Berars, Chutia Nagpur and South Behar, Central India, and Eastern Rajputana, and hence over the area of highest temperature and of greatest excess of temperature during the month. The deficiency decreased in amount from this central area. The deficiency was absolutely greatest at Hazaribagh, Sambalpur, Raipur and in the Berars, and at Simla and Chakrata. The deficiency was small in Assam and Bengal and decreased in amount southwards, and

in the neighbourhood of the coasts in Southern India and the Eastern Peninsula there was a slight excess.

*May.*—The variations in this month were smaller than in the preceding month and were also more irregular. The humidity increased in Southern India and was above the average over the Deccan, as well as in the coast districts of Bombay and Madras. It was normal in Bengal, and slightly in defect in Orissa and Assam. It was, on the other hand, above the average in Chutia Nagpur and Behar, and the North-Western Provinces, and also in the hill districts of Northern India. The humidity was below the normal to a very slight extent in North-West India (the Punjab, Rajputana, Sind and Guzerat) and the Konkan. May is usually the driest month of the year in Upper India and that in which the lowest humidities are recorded. The following give the lowest 10 A.M. humidities registered during the month:—

| Stations.           | Per cent. | Stations.         | Per cent. |
|---------------------|-----------|-------------------|-----------|
| Peshawar . . . . .  | 7         | Neemuch . . . . . | 8         |
| Kurrachee . . . . . | 8         | Seoni . . . . .   | 7         |
| Sutna . . . . .     | 9         | Indore . . . . .  | 9         |
| Gorakhpur . . . . . | 7         |                   |           |

At the hill stations of the North-Western Provinces the humidity was considerably above the average.

*June.*—The absolute humidity was either normal or above the average over the whole of India, with the exception of the Indus Valley, an area including Allahabad, Benares, Patna and Gya, Hazaribagh and Burdwan, and that portion of Rajputana represented by Pachpadra, Jeypore and Bickaneer. The observations of the latter station, if they can be accepted, shew a very large deficiency in Central Rajputana. The variations of the relative humidity were very generally small in amount. There was a moderate increase of humidity in the Deccan and Carnatic coast districts and in the Central Provinces. The variations were very uniform in amount in the Central Provinces and Berar.

*July.*—The air was more humid than usual in almost every part of India. The increase in the absolute humidity or amount of moisture in the air was most marked in the Punjab, East Rajputana, and the North-Western Provinces, and to a somewhat less extent in the Deccan and Coromandel coast districts. The greatest excess was shewn by Quetta and Peshawar, where the air contained nearly 25 per cent. more moisture than the normal. The Bickaneer observations, if they may be trusted, on the other hand shew that the air was excessively dry in Central Rajputana. The relative humidity presented the same general features as the absolute humidity. There was a considerable excess in the Punjab, the North-Western Provinces, East Rajputana, Central India, the Central Provinces, the Deccan, and Carnatic. In other districts the abnormal variations were small and of little importance.

*August.*—The variations during this month were smaller than during any other month of the year, and over the greater part of the country the humidity conditions were normal. There was a slight excess in the North-Western Provinces, Central India, the Deccan and Carnatic coast districts. The air was abnormally dry locally at Bickaneer and Jacobabad.

*September.*—The rains ceased earlier than usual and the month was unusually dry in Upper and Central India. In the Central Provinces and Berar the deficiency in the humidity averaged 9 per cent., and in the Punjab 7 per cent. The deficiency was greatest in the Berars and at Nagpur, Pachmarhi and Hoshangabad, and also at Bickaneer, where it varied from 10 to 14 per cent. The variations were negative in all other districts, except Bengal, Behar and the North-Western Provinces, where the air was slightly damper than usual.

*October.*—The humidity conditions of this month were very unusual. A succession of small storms formed in the neighbourhood of the North-West Coast of the Bay and advanced either to the north-west into South Behar or west into the Central Provinces. The indraught to these small and very slow-moving storms brought up unusually large amounts of vapour into Northern and Central India, and the air was hence very much more humid than usual. The relative humidity was normal in Arakan and Pegu and Assam, and slightly below the average in Ceylon. It was in excess in all other districts. The excess averaged 14 per cent. in South Behar and Chutia Nagpur, 13 per cent. in Central India, and 12 per cent. in the Central Provinces. This excessive humidity was most marked in certain portions of the Central Provinces and Central India. It was more than 15 per cent. in excess at Jhansi, Saugor, Pachmarhi, Chikalda, Amraoti, Nowgong, and Sutna, and was absolutely greatest at Jhansi, where the relative humidity was 20 per cent. above the normal. It was also considerably above the average in the area represented by the stations of Poona, Sholapur, Belgaum, Secunderabad, Malegaon, at each of which stations the excess was above 10 per cent. The excess in the Gangetic plain averaged 6 per cent., in the Punjab 3 per cent., and in Lower Bengal 2 per cent. In the extreme south of India there was a slight deficiency which was most marked at Coimbatore, Trichinopoly, and Madura. In Sind, also, the air was considerably drier than usual.

*November.*—The relative and absolute humidity varied less but more irregularly from the normal than in October. The absolute and relative humidities were both well above the average in South Behar, Chutia Nagpur, Central India, the Gangetic plain, the Punjab, the Central Provinces and Orissa, and also in the Konkan. The relative humidity was 10 per cent. or more in excess at Sutna, Rajkot and Surat. It was slightly in excess in Bengal, but over the Himalayan area and in Assam there was a small deficiency. The humidity was normal in the Deccan, but further south, in the Carnatic coast districts, Southern Madras, Travancore and Ceylon, it was below the average. The deficiency in Southern India was greatest as in October at Madura and Coimbatore, and at Trincomalee and Batticaloa in North-East Ceylon.

*December.*—Over the whole of Northern and Central India and in the Deccan the humidity varied slightly from the average and generally in excess. In some parts of Central India and the Central Provinces (including Sutna, Nowgong, Indore, and Hoshangabad) the excess in the relative humidity was rather large, varying from 7 to 9 per cent. In the extreme south of India and Ceylon the same conditions prevailed as in the two preceding months. Madura and Coimbatore shewed the greatest deficiency in Southern India, and Kandy in Ceylon the unusually large deficiency of 21 per cent.

---

The preceding remarks have shewn that February and April were drier months than usual, and that September was an unusually dry month in the interior, and that in the

remaining months of the year, the humidity was, on the whole, above the average. The variations from the normal conditions were not large, except in the month of October, when the humidity of the atmosphere was very considerably above the average over the whole of Northern and Central India and the Deccan. The averages of all the anomalies in the monthly columns of Table XXI give the following results:—

|                          | January. | February. | March. | April. | May.  | June. | July. | August. | September. | October. | November. | December. | Year. |
|--------------------------|----------|-----------|--------|--------|-------|-------|-------|---------|------------|----------|-----------|-----------|-------|
| Number of stations . . . | 114      | 115       | 114    | 116    | 116   | 117   | 116   | 118     | 118        | 118      | 118       | 117       | 118   |
| Variation . . .          | +·021    | —·021     | +·012  | —·029  | +·017 | +·013 | +·019 | +·006   | —·015      | +·052    | +·025     | +·001     | +·008 |

The mean anomaly of the year was hence +·008, or the absolute humidity was very slightly in excess. There was a marked contrast of conditions between Southern India and Central and Northern India, greater humidity in the one area generally occurring with diminished humidity in the other. According to the figures in the column of Tables XXIII and XXIV the districts in which the humidity was most persistently above the average included South Behar, Chutia Nagpur, Central India, East Rajputana, and the Gangetic plains. The greatest deficiency in the average amount of moisture occurred in Ceylon and the Madura and Tinnevely districts of South Madras.

### CLOUD PROPORTION.

The proportion of cloud is estimated, in the usual way, in tenths of the sky expanse, an overcast sky being denoted by 10, a cloudless sky by 0. From the very nature of the observations, it follows that the estimated amounts at different stations must be affected, to some extent, by the personal equation of the observer; and doubtless some of the differences to be observed in the tables, are mainly attributable to this cause. The general excess of the present year at Batticaloa, and the high deficiency at Sib-sagar, Salem and Madura, are probably due, in part, to a change of the observer or of his method of estimating; but, on the whole, the observations are fairly accordant, and the general result of a number of stations, similarly situated, may be accepted with considerable confidence as indicating the variations of cloudiness in different months, or in different parts of the country.

Table XIII (Appendix) gives the monthly means of the observations of stations for the hours of observation, (except in the case of the Ceylon stations), and also the daily averages of these. At the large majority of the stations, the hours are 10 h. and 16 h. only, (10 A.M. and 4 P.M.), but at Calcutta, Bombay, Allahabad, Jeypore, Lahore, Leh, Chamba, Vizagapatam, and Saugor Island, the observations are recorded four times daily, *viz.*, at the two first mentioned stations and Leh, at 6 h. and 22 h., (6 A.M. and 10 P.M.), and the remainder at 4 h. and 22 h., in addition to those of 10 A.M. and 4 P.M. At certain Madras stations, 10 P.M. is substituted for 4 P.M. Whatever the hours, the figures in the column of means are the averages of those in the subsequent columns without correction; a practice which has been followed in previous reports.

Table XXV below gives the averages, similarly obtained from the observations of several years at 129 stations, being in no case taken from less than three years' observations. Tables XXVI and XXVII shew the differences for the year 1886, in excess or defect of these averages, first at the individual stations, and second, as summarized for the geographical divisions adopted in previous sections of this report:—

TABLE XXV.—Average proportion of clouded sky in each month, deduced from the registers of past years.

| STATIONS.            | Years. | January. | February. | March. | April. | May. | June. | July. | August. | September. | October. | November. | December. | Year. |

*January.*—January was an unusually cloudy month. The cloud amount was in excess in all districts, except the Malabar and Carnatic coasts and Tenasserim. The excess was greatest in the Punjab, the North-West Himalayas and the Central Provinces. In these districts the average amount of sky covered with cloud was from 30 to 75 per cent., about the normal amount. The variations in the cloud amount were similar to those of the humidity, which was above the average in all parts of India, except Sind and East Bengal. The excess was most marked in the north of the Punjab. As cloud formation usually occurs at a very considerable elevation in the cold-weather months generally much greater than during the rainy season, the increased cloud in the higher strata and the excessive humidity of the lower strata appear to indicate that there was a larger amount of moisture than usual throughout the whole of the lower as well as the higher strata. The upper cloud, I believe, to be formed almost entirely in the upper or south-west return current of the north-east monsoon, which is a humid current as contrasted with the lower one. The rainfall due to disturbances in this current is small, compared with that which occurs during the rains, and is heaviest in the higher hills, and, so far as can be judged, increases in amount as the elevation increases up to heights of at least 15,000 or 20,000 feet in the Himalayas, in which respect it is opposed to the rainfall of the summer monsoon.

*February.*—The skies were much less clouded in this month than in January, and the cloud amount was below the average, except in the Himalayan area and the Punjab, and also in Arakan, Pegu and Tenasserim. The deficiency was most marked on the Malabar coast, and in Bengal, Orissa and the Gangetic plains.

*March.*—The variations in the amount of cloud resembled those of January rather than February. The cloud amount was, on the whole, in excess to a moderate degree. The excess was most marked in the North-West Himalayas and the Punjab, and to a slightly less extent in the North-Western Provinces, Behar, Chutia Nagpur and Orissa. There was less cloud than usual on the Malabar coast and in Ceylon, the Deccan, and the Carnatic, but the deficiency was small, except on the Malabar coast, where skies were unusually free from cloud.

*April.*—April was characterised throughout by dry hot weather, and the skies were unusually free from cloud over the whole of India throughout the month. The deficiency in the cloud amount was proportionately largest in Behar, the North-Western Provinces, West Rajputana, the Nerbudda valley, Lower Bengal, and also in Tenasserim. At many stations the average cloud amount for the whole month was almost *nil*. There was a very slight excess in the Sikkim Himalayas. The deficiency in the cloud amount was small in Assam generally. It decreased in amount southwards from North and North-Western India, and in Ceylon and the Bay Islands there was a very slight excess. The deficiency was almost as large and marked in Pegu and Arakan as it was in Northern India.

*May.*—A hot and dry April is generally followed by increased strength in the sea-winds, more especially in the districts at the head of the Bay, and by frequent slight atmospheric disturbance and thunderstorms. This was the case in May 1886. The mean cloud amount of the whole country was hence above the normal amount, and to an even greater extent than in March. The greatest excess of cloud amount was in Arakan and Pegu, Orissa, Behar, Chutia Nagpur and to a less extent in Bengal, the Sikkim Himalayas and the Central Provinces. The south-west monsoon humid current was felt in Ceylon and Southern India, and at the entrance to the Bay slightly earlier than usual, and caused the average cloud amount of the month to be considerably in excess in Ceylon, the Bay Islands, the Malabar coast and the Konkan and to a less extent in the Deccan and the Carnatic Coast districts. There was a slight deficiency of cloud in the Punjab and Rajputana and the North-West Himalayas.

*June.*—The cloud amount was generally in excess in Southern India and below it in Northern India, but the variations in opposite directions almost compensated each other and the average cloud amount for the whole country was normal. There was less cloud than usual in the Himalayan area. In the Punjab the local variations were very large and irregular, but, on the whole, there was a slight excess. There was less cloud than usual in the North-Western Provinces, except at Jhansi, where there was a large excess. The cloud amount was unusually large in Orissa and to a slightly less extent in the greater part of the Central Provinces, and more especially those districts bordering on Behar. The cloud amount was generally normal or slightly in excess in Bengal and Behar, but there was a marked deficiency in Assam (greatest at Sibsagar). It was also generally in excess in the Deccan, Konkan, and Southern India. Ceylon and the Madura, Trichinopoly and Coimbatore districts, and probably the Tinnevely districts had considerably less cloud than usual. The deficiency was very marked at Galle and Newera Eliya. There was a moderate excess of cloud in the Bay Islands and in Pegu, but there was much

local irregularity, the cloud amount being considerably in excess at the great majority of stations in the northern districts and in defect to a less extent in the southern. Skies in Sind, Guzerat and Western Rajputana were almost free from cloud during the whole month, but there was a moderate excess of cloud in the south-eastern districts of Rajputana and in Bundelkand, more especially at Nowgong.

*July.*—There was a larger influx of aqueous vapour and cloud brought up by the south-west monsoon than usual, and the cloud amount was above the average in all districts except Tenasserim. The excess was largest in the Malabar coast districts, Arakan, Pegu, Orissa, Rajputana and the Punjab. In the Gangetic plains the variations were local and irregular, but there was on the whole a slight excess. There was slightly less cloud than usual in some parts of Behar, Assam (except in Cachar), and probably North Bengal, but a moderate excess in South and East Bengal. Over the whole of Southern India and in Ceylon and the Bay Islands there was, almost without exception, somewhat more cloud than usual.

*August.*—The general conditions of this month were very similar to those of the preceding month, and the cloud proportion was above the average in all districts except Tenasserim and the Punjab. The general excess was not quite so large as in the month of July. The excess was greatest on the Malabar coast, Arakan and Pegu, Orissa and Sambalpur, or in the same districts as in the preceding month and therefore probably due to the same conditions and actions. The cloud proportion was slightly larger in Bengal and Assam, Behar, Chutia Nagpur, and in the Central Provinces. The increase was most marked in Eastern Bengal and Orissa. The variations were very large and somewhat irregular in Burma: there was much more cloud than usual at Thayetmyo and a large deficiency at Moulmein. The general character of the variations in Pegu were hence almost identical with those of the previous month. In Upper India the variations were large, and they differed very considerably at adjacent stations in the North-Western Provinces. The amount of cloud was in defect at all the plain stations in the Punjab except Delhi and Ludhiana. There was more cloud than usual at the hill stations. The deficiency in the Punjab was one of the first symptoms of the earlier retreat of the south-west monsoon current than usual.

*September.*—The rains ceased earlier than usual in Northern and Central India. The cloud proportion was hence very considerably below the average, more especially in the North-West Himalayas, the Punjab, and Rajputana, and to a less extent in the North-Western Provinces. The change was due chiefly to the weakness of the Bombay current, for the cloud amount in the Konkan, Rajputana, and the Central Provinces was almost as largely and universally in defect as it was in Upper India. At many stations in Upper and North-Western India the average cloud amount of the month was barely half the normal value. The Bengal current continued to bring up much vapour and cloud, and the cloud proportion was considerably in excess in Arakan, Bengal, Assam, Orissa, Sambalpur, Behar, and Chutia Nagpur. The excess was universal in these districts, but was most strongly marked in Orissa, Sambalpur, Chutia Nagpur, and South Behar. There was also a very general deficiency in the cloud amount over the whole of Southern India except the Malabar coast to which the retreating south-west monsoon current gave more cloud and rain than usual.

*October.*—The weather was very abnormal during this month. A succession of small whirls formed near the head of the Bay and passed either into Behar, the Central Provinces

or the Deccan. They brought up much more cloud than usual across the north and north-west coasts of the Bay, which extended over the greater part of India. The rainfall, except in some parts of Bengal, was also generally above the average. The excess in the cloud amount was most marked in Orissa, the Central Provinces, Chutia Nagpur and Behar, and the eastern districts of the North-Western Provinces, in each of which districts it was from 50 to 100 per cent. above its normal amount. There was also a considerable excess in Bengal and the Deccan. In the Punjab, West Rajputana and Sind, the amount of cloud was very small but slightly above the average. In Southern India, although there were largish local variations, the amount on the whole was slightly above the average. It was in defect in Ceylon.

*November.*—This like the preceding month was unusually disturbed, but the atmospheric perturbations were unlike those of October, and consisted of two extensive cyclonic storms which formed in the Bay and advanced west-north-west. The first of the two crossed the Deccan into the Arabian Sea and the other broke up in the Deccan shortly after it reached land near Cocanada. These storms increased the cloud amount over the greater part of the area which they influenced and affected, or in South Behar, Chutia Nagpur, Bengal, Orissa, the Central Provinces, Arakan, Pegu and the Bay Islands. The increase was largest in Sambalpur, Arakan, Pegu and the Bay Islands. There was less cloud than usual in Southern India due to the fact that, during the slow growth of the cyclonic storms, north-east monsoon humid winds were suspended in Southern India, and replaced by dry north-westerly or westerly winds, and the excessive cloud during the passage of the storms did not compensate for the previous deficiency. The defect was most marked on the coast of the Carnatic and the most southern districts of Madras and was small in the Deccan. There was also a large local deficiency in Assam where the weather was unusually bright and clear. Skies were also on the average slightly less clouded than usual in Upper India. The deficiency was most marked at Leh and Kailang in Thibet and at Sibsagar in the eastern districts of Assam.

*December.*—This month was more cloudy than usual over the whole of Northern and Central India. The excess was greatest in the Central Provinces, the Nerbudda Valley, Eastern Rajputana, the Deccan and the North-Western Provinces. The cloud amount was slightly in defect in Ceylon, Arakan, the Carnatic, the Malabar coast districts, the Bay Islands and Tenasserim.

The year 1886 was like its predecessor more cloudy than usual. On the mean of all stations the cloud amount was in excess in nine out of twelve months and also for the whole year. The excess was largest in the months of January and October and to a less extent in December. There was a considerable deficiency in April, due to unusually pronounced hot-weather conditions, and in September, due to the early retreat of the monsoon current from Northern, North-Western and Central India.

|                          | January. | February. | March. | April. | May.  | June. | July. | August. | September. | October. | November. | December. | Year. |

| Mean anomaly . . .       | +0.69    | -0.23     | +0.36  | -0.68  | +0.36 | +0.08 | +0.38 | +0.26   | -0.49      | +0.86    | +0.04     | +0.40     | +0.17 |

The annual or total variations of the cloud amount differed very considerably in different parts of India. The cloudiest provinces were Orissa, Sambalpur, South Behar, and Chutia Nagpur, over which there was a stronger determination of the Bengal current and much heavier rainfall than usual. There was a moderate excess of cloud amount in the Punjab, East Rajputana and Central India, the Central Provinces, the Konkan, Arakan and Pegu. In Bengal and the North-Western Provinces and also on the Malabar coast the cloud proportion was very slightly in excess. In Western Rajputana, Assam, and on the coast of the Carnatic there was a slight deficiency of cloud. In Tenasserim alone was the cloud amount considerably below the normal.

### RAINFALL.

In the present report, the rainfall of India and its dependencies is represented by 500 stations (14 more than were given in the report for 1885); and for 18 of these, two or more independent registers are given. The rainfall registers of the extra-Indian stations, Aden, Bushire, and Singapore, are also given. The monthly and annual totals of these 518 registers are shewn in Table XIV, in the Appendix, classified under their respective administrative divisions, according to the following scheme:—

| PROVINCES.                        | Stations. | Registers. |
|-----------------------------------|-----------|------------|
| Arabia . . . . .                  | 1         | 1          |

| PROVINCES.                 | Stations. | Registers. |
|----------------------------|-----------|------------|
| Madras . . . . .           | 75        | 78         |
| Mysore and Coorg . . . . . | 9         | 9          |
| Ceylon . . . . .           | 12        | 12         |
| Burma . . . . .            | 28        | 28         |
| Bay Islands . . . . .      | 3         | 3          |
| Singapore . . . . .        | 1         | 1          |

The stations, the registers of which are now given for the first time, are, Khetre in Rajputana, Mandalay, Shweybo, Yeu, Minbu, Pyinmana (Ningyan), Pagan, Kyanksai, Bhamo, Kendat, Toundwingyee, Ye Methin, Fort Sagaing, and Mingin, all in Upper-Burma, and Cocos Island between Cape Negrais and the Andamans.

Nearly all the above new stations are situated in those parts of the country that were either unrepresented, or but insufficiently represented, in previous reports.

The map, Plate I, shews the positions of all the stations in India and its dependencies, the registers of which are given in Table XIV (Appendix). The rain-gauges in use in Bengal, Bombay, Madras, the Central Provinces and Berar generally, and at the meteorological observatories in the North-Western Provinces, the Punjab, Burma, and other provinces, are either those of Symon's pattern, 5 inches in diameter, or Glashier's, 8 inches in diameter, and furnished with graduated measure-glasses, into which the collected rain-water is poured. The gauges are placed on the ground, the mouth, in general, about one foot above the ground level. At the rain-gauge stations in the Punjab and North-Western Provinces, (not being observatories), other forms of gauge are used; generally Fleming's float-gauges, the mouth of which stands 3 feet above the ground, and the registers of which must, generally, be regarded as less exact.

At the majority of the stations, as far as is known, the rainfall is measured at 6 P.M. Many stations in Rajputana, Hyderabad, Madras and Burma are exceptions to this rule, and, at most of these, it appears to be the practice to measure the rainfall at some morning hour, frequently at 6 A.M., and in Madras, at noon. It is much to be desired that this practice should be discontinued.

Table XV (Appendix) gives the number of days on which the rainfall has been measured at 500 stations. From this table, it appears that the wettest station was Newera Eliya where rain fell on not less than 219 days, and next thereto Galle with rain on 217 days, and Colombo, in Ceylon, with 195 rainy days, follow. As in the previous year, the least rainy station was Shikarpur in Sind, with rainfall on 11 days, giving a total of 3.52 inches. Sehwan, in Sind, had only 12 rainy days, but the rain was heavier, amounting to 4.95 inches, and Mozuffargarh in the Punjab had also only 12 rainy days, during which 4.9 inches fell; while Leh, with 33 rainy days, had only 2.36 inches. The rainfall of Cherra Poonjee<sup>1</sup> was 462 inches; and next in order come Mahableshwar, with 263 inches, Baura fort, on the Western ghats, with 261 inches, and Baxa

<sup>1</sup> According to the earlier registers, the average rainfall of this station greatly exceeded that to be deduced from the registers since 1862, and more especially from those since 1870. This is probably to be accounted for by the fact that the rain-gauge has occupied at least four different positions in the station, and, as might be anticipated, when regard is had to the very peculiar topography of the place, different parts of the little plateau are very unequally exposed to the rain-bearing current.

in the Bhootan Dooars, with 238 inches. Quantities exceeding 200 inches were also registered at Matheran on the Western ghats (215 inches), and Tavoy in Tenassarim (215 inches). The smallest local rainfalls of the year were 0·58 inch at Aden, 2·41 inches at Jacobabad, and 2·64 inches at Rohri.

The following Table, XXVIII, gives the average rainfall, as deduced from the registers of past years, at 479 stations (including two stations at Alipore, Calcutta, and two in Bombay) :—

| Provinces.                         | Stations. | Provinces.                         | Stations. |

*January.*—The rainfall of the month was considerably above the average in the Punjab, and slightly above it in the hills and adjacent plain districts of the North-Western Provinces. The month was unusually dry in all other parts of India, and the rainfall was everywhere very small in amount and much below the average. The normal average rainfall of the month on the Punjab plains is very nearly one inch, whilst the average for January 1886 was nearly  $2\frac{1}{2}$  inches, or more than double the normal amount. The following table gives some of the more conspicuous cases of the increased rainfall in the Punjab :—

|                    | Actual rainfall.<br>January 1886. | Average rainfall.<br>January 1886. | Excess. |
|--------------------|-----------------------------------|------------------------------------|---------|
| Simla . . . . .    | 6'24                              | 2'84                               | +3'40   |
| Kilba . . . . .    | 17'57                             | 10'05                              | +7'52   |
| Sialkot . . . . .  | 4'15                              | 1'41                               | +2'74   |
| Lahore . . . . .   | 2'31                              | 0'69                               | +1'62   |
| Ludiana . . . . .  | 2'98                              | 1'35                               | +1'63   |
| Gujrat . . . . .   | 4'20                              | 1'83                               | +2'37   |
| Rohtak . . . . .   | 2'70                              | 0'77                               | +1'93   |
| Mooltan . . . . .  | 1'44                              | 0'39                               | +1'05   |
| Peshawar . . . . . | 4'01                              | 1'63                               | +2'38   |

The first rainy period of the month was on the 3rd and 4th. The largest amounts fell in the Himalayan and hill districts of the Punjab and the North-Western Provinces. 1'2 inches fell at Murree on the 3rd, 1'4 inches at Simla on the 4th, and 1'4 inches at Jullundur on the same day. Light showers fell in the Punjab plains and the western districts of the North-Western Provinces. The first important snow-fall of the year in Kulu and the North-Western Himalayas occurred on the 3rd January. There appears to have been no snow or rain in the highlands of Afghanistan and Beluchistan during this storm.

The second rainy period extended over the 13th and 14th, and occurred in the same districts as in the preceding case. The rainfall was much smaller in amount and more irregularly distributed.

The third disturbance of the month was much more extensive, and gave a much larger amount of rain. It commenced on the 18th in the Punjab, and continued (with a brief interval of fine dry weather in the plains on the 21st) until the evening of the 24th. It extended to the North-Western Provinces on the 19th, and lasted until the 21st, except on the hills, where rain and snow also fell on the 23rd and 24th. The same disturbance passed eastwards through Oudh on the 20th and Behar on the 21st, beyond which it apparently did not extend, although a few light showers occurred in Sikkim and Assam on the 21st and 22nd.

Heavy snow is reported to have fallen during this storm on the Safidkoh. In the Khyber and Afridi Hills to the west of Peshawar two feet of snow fell, and still larger amounts are stated to have fallen on the more distant and higher Bara, Tirah and Morgha ranges. Further falls occurred in the same hill districts on the 22nd, 23rd and 24th. No snow fell on Kulu between the 4th and the 22nd, when a very heavy fall brought the snow line down from 6,500 to 4,500 feet.

The following table gives the largest rainfalls during this period :—

| Date.              | Stations.            | Inches. |
|--------------------|----------------------|---------|
| January 19th . . . | Musoorie . . . . .   | 2'75    |
| Ditto . . . . .    | Kilba . . . . .      | 2'60    |
| Ditto . . . . .    | Simla . . . . .      | 1'89    |
| Ditto . . . . .    | Murree . . . . .     | 2'22    |
| Ditto . . . . .    | Peshawar . . . . .   | 2'22    |
| Ditto . . . . .    | Sialkot . . . . .    | 1'53    |
| Ditto . . . . .    | Almora . . . . .     | 1'34    |
| January 20th . . . | Kilba . . . . .      | 4'20    |
| Ditto . . . . .    | Simla . . . . .      | 1'20    |
| Ditto . . . . .    | Gujrat . . . . .     | 1'50    |
| Ditto . . . . .    | Dharamsala . . . . . | 1'31    |
| Ditto . . . . .    | Chakrata . . . . .   | 1'85    |
| Ditto . . . . .    | Ranikhet . . . . .   | 1'63    |
| Ditto . . . . .    | Roorkee . . . . .    | 1'46    |
| Ditto . . . . .    | Dehra-Dun . . . . .  | 1'61    |
| Ditto . . . . .    | Philibit . . . . .   | 1'50    |
| January 23rd . . . | Kohat . . . . .      | 1'21    |
| Ditto . . . . .    | Abbottabad . . . . . | 1'20    |
| Ditto . . . . .    | Murree . . . . .     | 1'60    |
| Ditto . . . . .    | Kilba . . . . .      | 1'20    |

The rainfall was from 1 to 3 inches in excess in all districts of the Punjab except in Delhi, Sirsa, Montgomery, Shahpur, Gurgaon and Kurnal, where on the whole the average amount was received. In the western districts of the North-Western Provinces it was slightly in excess, but over the eastern districts and in Behar, it was from a quarter of an inch to one inch below the normal.

Some showers fell in Rajputana on the 18th and 19th, and in Central India on the 21st,

22nd, and 23rd. In Bengal and Assam there was very little rain. Light local showers of no great importance occurred on the 25th, 26th, and 27th in Orissa and Chutia Nagpur, and on the 24th, 25th, and 28th, in several districts of South-West Bengal. In Assam showers were received between the 21st and the 28th, but the average total amount was barely a quarter of an inch.

The month was practically rainless in the remainder of India, with the exception of the southern districts of Madras, (*i.e.*, Madura, Trichinopoly, Negapatam, Tanjore, South Arcot, and Tinnevely) in which showers were received between the 2nd and 7th. Tranquebar obtained 2·3 inches on the 2nd, Negapatam 3·22 inches on the 3rd, and Cuddalore 1·33 inches on the 5th.

The following table summarizes the chief features of the rainfall of the month:—

| DISTRICTS.                                 | Normal average<br>rainfall of<br>month. | Actual average<br>in<br>1886. | Excess<br>or defect in<br>inches. | Excess or defect<br>expressed as a<br>percentage. |
|--------------------------------------------|-----------------------------------------|-------------------------------|-----------------------------------|---------------------------------------------------|

*February.*—Was an unusually dry month, and the rainfall was small in amount and almost entirely confined to the hill districts of the Punjab and North-Western Provinces. There were four brief periods of slightly disturbed weather and of rain or snowfall in Northern India; *viz.*, the 1st, the 5th to the 9th, the 15th to the 17th, and the 26th to the 28th. An unusually heavy fall of snow is reported to have fallen on the 15th and 16th in the Afghan hills. 10 to 15 feet are estimated to have fallen on the Safedkoh, 3 feet on the Tirah plains, and from 1½ to 2 feet on the Kurram valley. Snow fell on the 31st January and 1st February in the Khyber and Afridi hills, and again on the 15th to the 17th. This last fall was 3 feet deep on the Lundi Kotal and 2 feet at Ali Musjid. The snowfall in the North-West Himalayas was unusually small in amount at the lower elevations, and the weather during the month was reported to have been fine and mild in Kulu and the Sutlej valley.

A few showers were received in the northern districts of the Punjab on the 1st, and again on the 15th, 16th, and 17th, but the amounts were very small, and the rainfall of the month was nearly as much below the average as that of January was above it, the deficiency averaging for the whole of the Punjab '66 inch.

The month was almost rainless in Rajputana, Central India (with the exception of the 16th on which one or two light showers fell), the plain districts of the North-Western Provinces, Orissa, Chutia Nagpur, South and East Bengal, the Berars, Hyderabad and Bombay.

Light showers were received in Behar on the 17th, in Assam on the 18th, and in North Bengal on the 17th and 18th. The deficiency averaged '4 inch in Behar, '75 inch in Assam, and 1 inch in Bengal. No rain fell in Madras during the month, except in the Negapatam and Tanjore districts, which received heavy local thunder showers on the 7th. Negapatam registered 4'09 inches on that day. In Burma heavy and fairly general rain was received between the 1st and 4th, and the rainfall in the southern districts was from 1 inch (at Diamond Island) to 3 inches (at Henzada) above the average. There was a very general deficiency in Ceylon, averaging '62 inch for the whole island.

The following table summarizes the chief features of the rainfall of the month :—

| DISTRICTS.                                 | Normal average rainfall of month. | Actual average in 1886. | Excess or defect in inches. | Excess or defect expressed as a percentage. |

*March.*—This month was unusually rainy in Northern India. The weather was on the whole more stormy than usual in the mountain districts of the North-West Himalayas and in Afghanistan. At Quetta 4 inches of rain fell and at Kelat 3'19 inches. Heavy snow is reported to have fallen in the earlier part of the month on the Safedkoh and Tirah and Ali Khel Maidan. It was however followed by unusually heavy rain which speedily melted away the snow on all but the highest elevations. The snowfall in Kulu was normal. There were frequent falls in the higher ranges, but on the whole the weather was mild. In Lahaul on the contrary, from the middle to the end of March, the weather was rough with much snow (especially on the 19th, 30th and 31st).

There were three well marked periods of disturbance in Upper India during the month. The first extended from the 6th to the 11th, and gave a heavy and general burst of rainfall over the whole of Northern and Central India. It apparently commenced in Beluchistan and Afghanistan on the 5th, as Kelat received 1'61 inches on that day, and Quetta 1'10 inches. The rainfall of the 6th and 7th was almost entirely confined to the hills and the Punjab; on the 8th and 9th rainfall was general over the Punjab, North-Western Provinces, and on the 9th and 10th in Behar and Bengal.

The following gives the heaviest rainfalls of each day, and partially illustrates the character and distribution of the rainfall :—

| Date.              | Stations.              | Inches. |
|--------------------|------------------------|---------|
| March 7th . . . .  | Simla . . . . .        | 1'10    |
| Ditto . . . . .    | Naini Tal . . . . .    | 1'60    |
| Ditto . . . . .    | Mussooree . . . . .    | 1'22    |
| Ditto . . . . .    | Amritsar . . . . .     | 1'30    |
| Ditto . . . . .    | Gujranwala . . . . .   | 1'20    |
| Ditto . . . . .    | Jhelum . . . . .       | 1'10    |
| Ditto . . . . .    | Guzrat . . . . .       | 1'10    |
| March 8th . . . .  | Guzrat . . . . .       | 2'30    |
| Ditto . . . . .    | Gurdaspur . . . . .    | 2'20    |
| Ditto . . . . .    | Jhelum . . . . .       | 2'00    |
| March 9th . . . .  | Dharmasala . . . . .   | 2'38    |
| Ditto . . . . .    | Budaon . . . . .       | 2'34    |
| Ditto . . . . .    | Almora . . . . .       | 1'67    |
| Ditto . . . . .    | Shahjehanpur . . . . . | 1'60    |
| Ditto . . . . .    | Bijnor . . . . .       | 1'50    |
| Ditto . . . . .    | Murree . . . . .       | 1'50    |
| Ditto . . . . .    | Etah . . . . .         | 2'40    |
| Ditto . . . . .    | Bankoora . . . . .     | 2'06    |
| Ditto . . . . .    | Cuttack . . . . .      | 1'75    |

| Ditto . . . . .    | Sitapur . . . . .      | 1'68    |
| Ditto . . . . .    | Dudhi . . . . .        | 2'02    |
| Ditto . . . . .    | Cuttack . . . . .      | 1'65    |
| Ditto . . . . .    | Banki . . . . .        | 1'95    |

Showers were also received during this period of slight and irregular disturbance in Central India and the Central Provinces, but the amounts were small as compared with those in Upper India.

The preceding account shews that the area of heavy rainfall was transferred from west to east across Northern India. It accompanied a general disturbance, and the passage of a barometric depression eastwards from the Punjab to Behar, Chutia Nagpur, and Orissa, but the rainfall was not connected with the depression in the same direct manner as in the cyclonic storms of the rains.

The second disturbance of the month in Upper India, on the 17th and 18th, was comparatively feeble, and the rainfall accompanying it was confined to the Punjab. Heavy

rain fell in the most northerly districts on the 18th. At Murree 3·7 inches were registered on that day, at Bannu 2·5 inches and at Peshawar 1·7 inches.

The third period of disturbance and rainfall in Upper India lasted from the 25th to the end of the month, and was like the preceding almost confined to the hills and the northern districts of the Punjab, *viz.*, Peshawar, Kohat, Bannu. Five inches fell at Murree during this period, 3·1 inches at Peshawar and 1·88 inches at Kohat.

Light showers fell in Central India and the Central Provinces from the 20th to the 24th, and in Bengal and Assam from the 21st to the end of the month. The latter showers were due to a hot weather disturbance in North-eastern India, and accompanied a series of thunderstorms. The 28th was the day of most general rainfall, and some heavy showers were received on that day in Lower Bengal. Jessore registered 3·39 inches, Khoolna 2·75 inches and Busseerhat 2·35 inches.

In Burma and Bombay the month was practically rainless. Showers were received on one or two occasions in all districts of Madras, with the exception of the Bellary, Madura, Tinnevely, and Tanjore districts. They were most frequent in Ganjam and the Circars, but the amounts were small.

The following table summarizes the chief features of the rainfall of the month:—

| DISTRICTS.                                 | Normal average<br>rainfall of<br>month. | Actual<br>average in<br>1886. | Excess or<br>defect in<br>inches. | Excess or defect<br>expressed as a<br>percentage. |

*April.*—This was a very dry month over nearly the whole of India. In Kulu the

weather in the valley was very mild, although there were several snowstorms in the higher ranges. There was a great snowstorm on the Rotang. In Lahoul the weather was very rough, cold and wet. Snow fell on ten days, from the 9th to 12th, on the 16th, and from the 20th to the 24th. In the Afghan hills the weather appears to have been fine and dry.

Frequent light showers fell at the hill stations of Upper India. The month was practically rainless in the Punjab plains, the North-Western Provinces, Central Provinces, Central India, and Rajputana. The average rainfall in that area varied from nil in Central Rajputana to 2 inches in the Sialkot, Rawalpindi, Guzerat, Kohat and Peshawar districts.

The month was as dry over the greater part of Bengal as in Upper India. A few showers were received in the eastern and northern districts, more especially between the 7th and 12th, and the 23rd to the 30th, but the amounts recorded only exceeded an inch at a few stations, chiefly in East Bengal.

The rainfall in Bengal during the month of April is mainly due to thunderstorms or norwesters, which are occasionally very severe and give heavy rain. The average rainfall of the month varies from a tenth of an inch in South and Central Behar to 6 inches in parts of East Bengal (at Dacca, Mymensing and Commillah).

The following table gives the deficiency in Bengal:—

|               |                        | Normal average.<br>April. | Average.<br>April 1886. | Variation. |

|               | { South . . . . .      | 0'42                      | 0'11                    | —0'31      |
| Chutia Nagpur | . . . . .              | 0'47                      | 0'12                    | —0'35      |

In Assam rain fell almost daily throughout the month. The largest amounts were received between the 11th and 14th and the 21st and the 25th. The total rainfall was slightly below the normal excepting in Cachar and the Garo and Khasia Hill districts. At Cherra Poonjee the rainfall of the month was 11'55 inches in excess, and at Sylhet 3'58 inches. The rainfall was practically normal in Cachar.

Over the greater part of the Bombay and Madras Presidencies no rain fell during the month. In the Deccan and Hyderabad local showers were received during the last week of the month. Also in the extreme south of India (or in the Madura and Tinnevely districts) and in Mysore and Coorg light occasional local showers were experienced; but over the whole of Southern India (with one or two local exceptions, of which Bijapur and Poona were the chief) the rainfall of the month was in defect and very small in amount.

In Burma no rain fell except in the southerly districts bordering on the Gulf of Martaban. The deficiency in that province varied from '25 inch at Thayetmyo to 3 inches at Moulmein and in Tenasserim (at Tavoy and Mergui).

Similar conditions prevailed in Ceylon as in India, and the rainfall of the month in that island was, although larger than in any part of India (Galle receiving 9·47 inches and Ratnapura 10·83 inches), in defect to a moderate extent at nearly all stations.

The following table summarizes the chief features of the rainfall of the month:—

| Districts.                                 | Normal average rainfall of month. | Actual average in 1886. | Excess or defect in inches. | Excess or defect expressed as a percentage. |

*May.*—This was a wetter month than usual over the whole of India almost without exception. Frequent thunderstorms occurred in Northern and Central India, and gave occasional rain of a more or less local character. In Bengal especially, some of the norwesters were very severe, and attended in one case at least with an exceptionally heavy burst of rain. The south-west monsoon in Southern India commenced during the third week of this month, and a small storm which passed from the Bay across the South Coromandel Coast, gave very heavy rainfall to all districts south of latitude 16° N.

Frequent showers occurred in the hills in Upper India. Thunder-showers, locally heavy, gave moderate and very irregularly distributed rain to the plain districts. These disturbances occurred chiefly during three periods—the 5th, 6th and 7th, the 15th and 16th, and the 28th, 29th, and 30th. Gurdaspur received 2·6 inches, and Hoshiarpur 1·75 inches during a storm on the 15th. On the same day the hill station of Kilba received 5 inches and that of Dharmsala 2 inches. The total rainfall of the month was generally in excess in the hills, and more northern districts, and locally at Hoshiarpur, Gurdaspur, Kurnal and Umballa, and in defect elsewhere.

In Rajputana and Central India the rainfall of the month is usually very scanty. A few local showers occurred, chiefly on the 15th and 16th and also on the 26th, 29th, 30th and 31st, but the rainfall was below the average generally.

The weather was more disturbed than usual in the North-Western Provinces, and showers were received in the plains during four disturbances, three of which commenced in the Punjab, and extended within 24 hours to the North-Western Provinces. The fourth was apparently transmitted from Bengal and Behar and was very feeble. The four periods of disturbance were the 6th and 7th, the 11th and 12th, the 16th and 17th, and the 29th, 30th and 31st. The most general of these was the third, which gave rain to the whole of the North-Western Provinces. Amongst the largest rainfalls were Mussooree, 2·38 inches, and Gorakhpur, 2·11 inches on the 16th.

In Bengal, the month was one of almost continuous slight disturbance, and of very frequent thunderstorms and norwesters. Thus the average number of rainy days in Bengal was 12·5, as compared with the normal 11·0, and in Behar 6·2 as compared with 4·3.

The most remarkable storm of the month occurred on the 12th in the Burdwan, Hooghly and Jessore districts and the 24-Pergunnahs. The following table gives the rainfalls during the storm at the reporting stations in these districts:

|                    | Inches. |
|--------------------|---------|
| Howrah . . . . .   | 4·80    |
| Alipore . . . . .  | 4·53    |
| Calcutta . . . . . | 4·52    |
| Burdwan . . . . .  | 4·20    |
| Khulna . . . . .   | 3·98    |
| Jessore . . . . .  | 3·91    |
| Tumlook . . . . .  | 3·50    |

The following gives the average rainfall of the month in each of the seven meteorological divisions of Bengal, and its variation from the normal:—

| DIVISIONS.                  | Average.<br>May<br>1886. | Normal<br>average.<br>May | Variation. |
|-----------------------------|--------------------------|---------------------------|------------|
| Orissa . . . . .            | 4·66                     | 3·59                      | + 1·07     |
| South-West Bengal . . . . . | 7·83                     | 5·11                      | + 2·72     |
| East Bengal . . . . .       | 10·30                    | 9·45                      | + 0·85     |
| North Bengal . . . . .      | 9·64                     | 8·30                      | + 1·34     |
| North Behar . . . . .       | 4·46                     | 2·74                      | + 1·72     |
| South Behar . . . . .       | 2·80                     | 1·93                      | + 0·82     |
| Chutia Nagpur . . . . .     | 2·97                     | 2·41                      | + 0·56     |

Frequent showers were received in Assam during the month, the chief periods of general rain being from the 1st to the 5th, from the 8th to the 13th, and from the 23rd to the 31st. The first of these periods gave the largest amounts and heaviest falls during the month. On the 2nd, 9·58 inches fell at Cherra Poonjee, and 3·78 inches at Sylhet. The total rainfall of the month was however in defect to a moderate extent. The deficiency at Cherra Poonjee was 16·89 inches, at Debrugarh 8·08 inches, at Dhubri 6·51 inches and at Tezpur 5·66 inches. The average deficiency in the province was 3·83 inches or 25 per cent. of the normal rainfall of the month.

In the Central Provinces and Berars showers were received between the 1st and 4th, the 14th and 17th, and the 26th and 31st, which gave an average for the month of 1·04 inches, or '21 inch above the normal fall. There was an excess in some parts of the eastern districts, including Sambalpur and Raipur, but in all other parts of the province the rainfall was slightly in defect.

In Hyderabad showers were received during the same three periods of slight disturbance which gave rainfall to the Central Provinces. Some heavy falls were recorded on the 31st, amongst which were 4·73 inches at Lingsugur, 3·6 inches at Purbany and 3·5 inches at Raichore. The rainfall of the month was hence in excess at nearly all stations, the average rainfall, 2·08 inches, exceeding the normal by 1·04 inches.

In Bombay a few showers were received during the first week of the month, chiefly in the Deccan districts. Frequent showers fell after the 15th, more especially in the Deccan and Malabar Coast districts. The month was dry throughout in Sind. Over the greater part of the Bombay Presidency the rainfall of the month was in excess, but generally by small amounts, more especially in the Konkan. The only rainfall stations at which the excess was above 3 inches were Goa (+7·83 inches), Matheran (+5·01 inches) and Mahableshwar (+3·54 inches). The normal rainfall of the month in Sind is barely two-tenths of an inch.

Frequent showers occurred throughout the Madras Presidency during the month, in the northern as well in the southern districts. But the chief feature in the rainfall of the month was an unusually heavy burst which marked the commencement of the south-west monsoon current in the more southern districts of the Peninsula, and accompanied the passage of a depression across the South Coromandel Coast into Mysore. The following table gives the more noteworthy rainfalls:—

|                          | 23rd May. | 24th May. | 25th May. | Total. |
|--------------------------|-----------|-----------|-----------|--------|
| Negapatam . . . . .      | 5·23      | 0·12      | 2·32      | 7·57   |
| Kumbakonum . . . . .     | 5·00      | 0·95      | ...       | 5·95   |
| Shevaroy Hills . . . . . | 0·10      | 5·00      | 1·40      | 6·50   |
| Trichinopoly . . . . .   | ...       | 7·28      | ...       | 7·28   |
| Tanjore . . . . .        | 0·50      | 4·25      | 1·00      | 5·75   |
| Cuddalore . . . . .      | 4·48      | 1·50      | 0·20      | 6·18   |
| Madras . . . . .         | 1·79      | 1·14      | 0·15      | 3·08   |
| Vellore . . . . .        | 4·05      | 0·45      | 2·00      | 6·50   |
| Calicut . . . . .        | 2·00      | 4·75      | 2·20      | 8·95   |
| Tellichery . . . . .     | 3·60      | 6·10      | 2·00      | 11·70  |
| Cannanore . . . . .      | 0·20      | 1·40      | 9·40      | 11·00  |

The total rainfall was considerably in excess over the whole of Madras with the exception of the Kurnool and Bellary districts where there was a very slight deficiency. The excess was very considerable in the more southern districts (including Tinnevely and Travancore), in which it varied from 3 to 8 inches. At Trichinopoly it was 8·45 inches, Cannanore 8·11 inches, Tellichery 7·57 inches, Tanjore 7·71 inches, Vellore 6·54 inches, and Kumbakonam 6·03 inches. The excess was proportionally greatest in the Trichinopoly, Tanjore, and Negapatam districts, in which the normal average rainfall of the month varies from 2 to 4 inches. These districts hence received from two to five times their normal amount.

The rainfall of the month was in excess in Ceylon from the same cause as in Southern India. The excess was greatest on the south and west coasts. It was 9·04 inches at Colombo, 8·42 inches at Galle. There was a moderate excess on the northern coast at Trincomalee, where it was 1·49 inches, and at Puttalam, 0·36 inch.

Frequent showers fell in Burma from the 1st to the 26th, when the first burst of the south-west monsoon passed across the coast into the province, and general rain fell in every part of the province from the 26th to the end of the month. The burst was however comparatively feeble, and the only rainfalls exceeding 2·5 inches were 4·81 inches at Akyab on the 31st and 2·66 inches at Henzada on the 27th. The rainfall of the month was hence below the average to a moderate extent.

The following table summarizes the chief features of the rainfall of the month :—

| DISTRICTS.                                 | Normal average rainfall of month. | Actual average in 1886. | Excess or defect in inches. | Excess or defect expressed as a percentage. |
|--------------------------------------------|-----------------------------------|-------------------------|-----------------------------|---------------------------------------------|

*June.*—The month of June witnessed the complete establishment of both branches of the monsoon current over the whole of India. During the first week of the month, a heavy burst of rainfall advanced along the west coast of India as far north as Bombay. For some days afterwards rain fell in moderate amounts in the west coast districts, and extended eastwards into the western districts of the Central Provinces. On the 12th and 13th a cyclonic storm began to form at the head of the Bay due to a strong uprush of south-west humid winds in that area, and at the same time a fresh advance of winds took place along the west coast. The latter gave very heavy rain in the Bombay coast districts from the 14th to the 20th, after which the current expended itself chiefly in giving moderate rain to the Central Provinces and Central India. The storm which formed at the head of the Bay crossed the coast to the west of Saugor Island on the 16th, and drifted to the west-north-west into Upper India, giving the first burst of heavy monsoon rainfall to West Bengal, Chutia Nagpur, Behar, the North-West Provinces and the Punjab. During the remainder of the month the weather was of the ordinary monsoon type, frequent showers occurring in Western, Central, and Northern India.

The following table gives the rainfall at the more important stations on the west coast of India from the 13th to the 19th June, and illustrates the manner in which the rainfall advanced along that coast at the commencement of the south-west monsoon of 1886:—

|                   | 13th. | 14th. | 15th. | 16th. | 17th. | 18th. | 19th. |

| Surat . . . .     | ...   | ...   | ...   | 0·50  | 0·43  | 2·48  | 0·15  |

The following gives the more striking rainfalls that accompanied the passage of the cyclonic storm from Bengal to the Punjab:—

*June 16th.*—The storm centre crossed the coast near Saugor Island at 10 A.M.

|                              |              |
|------------------------------|--------------|
| Calcutta recorded . . . . .  | 4·43 inches. |
| Howrah     "     . . . . .   | 4·25     "   |
| Balasore     "     . . . . . | 4·80     "   |

*June 17th.*—The storm centre was in Chutia Nagpur—

|                               |              |                                |              |
|-------------------------------|--------------|--------------------------------|--------------|
| Hazaribagh recorded . . . . . | 3·32 inches. | Lohardagga recorded . . . . .  | 3·33 inches. |
| Ranchee     "     . . . . .   | 3·33     "   | Gobindpore     "     . . . . . | 3·04     "   |

*June 18th.*—The storm centre was to the south-west of Benares—

|                             |              |                          |              |
|-----------------------------|--------------|--------------------------|--------------|
| Fatehpur recorded . . . . . | 4'00 inches. | Dudhi recorded . . . . . | 5'42 inches. |
| Allahabad „ . . . . .       | 2'50 „       | Ghazipur „ . . . . .     | 2'70 „       |

Much heavier falls due to the Bengal humid current were reported at this time in some parts of Bengal and Orissa, as for example :—

|                     |              |
|---------------------|--------------|
| Jellasure . . . . . | 6'60 inches. |
| Bhuddruck . . . . . | 3'87 „       |

*June 19th.*—The centre was between Jhansi and Nowgong—

|                                |              |                            |              |
|--------------------------------|--------------|----------------------------|--------------|
| Bulandshahr recorded . . . . . | 4'30 inches. | Lucknow recorded . . . . . | 9'02 inches. |
| Shahjehanpur „ . . . . .       | 3'48 „       | Rae Bareilly „ . . . . .   | 5'18 „       |
| Muttra „ . . . . .             | 4'42 „       | Unao „ . . . . .           | 4'00 „       |
| Etah „ . . . . .               | 4'00 „       |                            |              |

*June 20th.*—The storm centre was to the south of Delhi at 10 A.M.—

|                               |              |                                |              |
|-------------------------------|--------------|--------------------------------|--------------|
| Ferozapore recorded . . . . . | 3'50 inches. | Bulandshahr recorded . . . . . | 2'20 inches. |
| Delhi „ . . . . .             | 2'25 „       | Bareilly „ . . . . .           | 2'81 „       |
| Aligarh „ . . . . .           | 3'40 „       | Agra „ . . . . .               | 2'60 „       |

*June 21st.*—The storm centre was near Lahore at 10 A.M.—

|                          |              |                               |              |
|--------------------------|--------------|-------------------------------|--------------|
| Delhi recorded . . . . . | 6'29 inches. | Gujranwala recorded . . . . . | 6'50 inches. |
| Amritsar „ . . . . .     | 4'90 „       | Karnal „ . . . . .            | 3'40 „       |
| Sialkot „ . . . . .      | 6'41 „       |                               |              |

*On the 22nd*—The storm was breaking up in the north of Punjab—

|                           |              |
|---------------------------|--------------|
| Jhelum recorded . . . . . | 4'00 inches. |
| Sialkot „ . . . . .       | 5'30 „       |

The most remarkable feature about the storm is that, although it gave very heavy rain in the plains from Bengal to the northern extremities of the Punjab, hardly any rain fell at the hill stations. Murree registered 0'3 inch between the 19th and 23rd, Simla 1'8 inches, Chakrata 1'7 inches, and Ranikhet 2'2 inches.

In the Punjab the month of June was almost rainless until the 20th of June, but from that day to the 23rd it received a heavy burst of rainfall due to the storm already described. The eastern districts, and more especially Sialkot, Gujranwala, Amritsar, Delhi and Gurgaon districts, obtained the largest amounts. A few showers fell during the remainder of the month. The total rainfall of the month was very considerably in excess in the eastern and south-eastern districts. Sialkot received 12'88 inches or 9'69 inches above the normal, Delhi 9'7 inches, or 7'05 inches above the normal, Gurgaon 9'8 inches, or 6'93 inches above the normal, Gujranwala 8'3 inches, or 6'42 inches in excess, and Amritsar 8'4 inches, or 6'01 in excess. There was a slight deficiency in the north-west and west districts and in the hills.

In Rajputana there were frequent showers from the 1st to the 7th, and fairly general rain fell from the 16th to the 26th. The rainfall of the month was hence considerably in excess, except in the area represented by Ajmere and Jeypore. The excess at Erinpura amounted to 7'66 inches, at Kotah to 4'21 inches, and at Jodhpore to 3'7 inches.

In the North-Western Provinces no rain of importance fell until the 18th. Heavy and general rain was recorded from the 18th to the 20th during the passage of the storm centre through the southern districts. Frequent showers occurred during the remainder of the month, the 24th, 25th, and 29th being days of very general rainfall. The rainfall was below the average at the hill stations, but was very considerably above the

average over all the plains districts. The following give some of the more remarkable variations :—

| STATIONS.              | Total<br>of month. | Excess. |
|------------------------|--------------------|---------|
| Farrukhabad . . . . .  | 10'95              | + 7'23  |
| Jaunpur . . . . .      | 11'98              | + 7'03  |
| Lucknow . . . . .      | 13'69              | + 8'72  |
| Hardoi . . . . .       | 11'00              | + 6'84  |
| Rae Bareli . . . . .   | 11'91              | + 7'47  |
| Shahjehanpur . . . . . | 11'10              | + 5'58  |
| Fatehpur . . . . .     | 8'70               | + 5'10  |
| Benares . . . . .      | 10'33              | + 5'37  |
| Ballia . . . . .       | 10'95              | + 5'63  |

The districts represented by these stations received from two to three times the normal rainfall of the month.

In Bengal there were frequent showers during the first week of the month. They were generally very light except in the south-eastern districts of East Bengal, in which some excessive rainfalls were recorded. At Chittagong 14'01 inches fell on the 3rd, due to a very small whirl which passed over it from the Bay, 5'48 inches on the 7th, and 3'93 inches on the 8th. Rain commenced to fall in connection with the large cyclonic storm of the month on the 14th in Orissa and South Bengal, and extended over the whole province of Bengal on the 15th and 16th. There was a short break on the 20th, 21st and 22nd, but with that exception rain fell on every day in moderately large amounts throughout the province. The distribution of the rainfall was very unequal. There was a very large deficiency in the northern districts of Bengal, and a moderate deficiency in North Behar. The rainfall was normal or slightly in excess in South Behar, and the greater part of Orissa. There was a large excess in the south-eastern districts of South-East Bengal, including Chittagong and Noakhally, and almost as large a defect in the northern districts of Mymensingh and Comillah. The following data illustrate the distribution of the rainfall in Bengal :—

| DIVISIONS.                  | Average<br>rainfall.<br>April 1886. | Normal<br>average.<br>April. | Variation. |
|-----------------------------|-------------------------------------|------------------------------|------------|
| Orissa . . . . .            | 12'10                               | 8'87                         | + 3'23     |
| South-West Bengal . . . . . | 8'94                                | 10'30                        | — 1'36     |
| East Bengal . . . . .       | 17'18                               | 18'47                        | — 1'29     |
| North Bengal . . . . .      | 12'24                               | 17'65                        | — 5'41     |
| North Behar . . . . .       | 6'78                                | 8'67                         | — 1'89     |
| South Behar . . . . .       | 7'71                                | 6'85                         | + 0'86     |
| Chutia Nagpur . . . . .     | 6'58                                | 8'47                         | — 1'89     |

Assam received almost daily rain, but the amounts were not quite so large as usual, and there was a considerable deficiency at many stations. The rainfall was 16·1 inches below the normal at Cherra Poonjee, which only received one very heavy burst of rainfall (from the 21st to the 27th), during which 61 inches was registered.

In the Central Provinces, there was frequent showers from the 1st to the 5th when the first rush of south monsoon winds occurred across the Bombay coast. This was followed by a lull, and an almost entire suspension of rainfall until the 14th, when the second burst of strong winds on the Bombay coast was immediately followed by general rainfall which continued in moderate amounts, but almost without intermission until the end of the month. The total rainfall of the month was from one to six inches below the average except in the Chanda and Sironcha districts. At Chanda it was 8·37 inches above the average, and at Sironcha 6·34 inches.

The rainfall in Hyderabad was obtained entirely from the Bombay current, and the conditions were similar to those in the Central Provinces. Moderate rain was received from the 1st to the 7th. This was followed by a short break until the 13th, when general rain commenced and fell at frequent intervals during the remainder of the month. The rainfall of the month was in excess by amounts varying from half an inch to eight inches.

The rainfall of the month was abundant in every part of the Bombay Presidency except in Sind. The first strong rush of winds occurred during the first week of the month. This was followed by a slight lull during which frequent light to moderate showers occurred. On the 13th and 14th another strong advance of monsoon winds commenced on the coast and continued throughout the remainder of the month. Amongst the heaviest rainfalls recorded during this period were—

|                        |                       |
|------------------------|-----------------------|
| Baura . . . . .        | 15·47 inches on 17th. |
| Honawar . . . . .      | 11·30 „ 17th.         |
| Mahableshwar . . . . . | 13·00 „ 18th.         |
| Bombay . . . . .       | 16·10 „ 18th.         |
| Matheran . . . . .     | 9·87 „ 18th.          |

The rainfall was greatly in excess at many stations, of which the following are the more remarkable examples:—

|                           | Excess.       |
|---------------------------|---------------|
| Bombay (Colaba) . . . . . | 22·66 inches. |
| Tanna . . . . .           | 14·36 „       |
| Karwar . . . . .          | 13·94 „       |
| Baura . . . . .           | 20·02 „       |

Little or no rain fell in Sind.

In the Madras Presidency rain fell on every day on the Malabar coast, but the total rainfall of the month was very considerably below the average. For example—

| STATIONS.           | Total rainfall,<br>June 1886. | Normal<br>average. | Deficiency. |
|---------------------|-------------------------------|--------------------|-------------|
|                     | Inches.                       | Inches.            | Inches.     |
| Mangalore . . . . . | 23·97                         | 37·83              | 13·86       |
| Cannanore . . . . . | 26·42                         | 38·98              | 12·56       |
| Calicut . . . . .   | 25·65                         | 34·95              | 9·30        |

In the eastern and southern districts there were frequent showers until the 9th or 10th. During the remainder of the month a few unimportant showers were received in the southern districts. Rain fell in larger amounts during this period in the Circars and Ganjam. The total rainfall of the month was generally above the average by moderate amounts, except in the Madura, Trichinopoly and Coimbatore districts, where it was slightly in defect. The excess was greatest in the Coromandel coast districts. It was 6·8 inches at Chingleput, 5·58 inches at Madras, and 5·31 inches at Arcot.

Frequent showers fell in Mysore and Coorg, but they were much lighter than usual, and the rainfall of the month was considerably in defect. In Ceylon it was slightly below the normal.

Burmah and Tenasserim received fairly general rain daily throughout the month. It was very irregularly distributed, but was generally in excess. The total rainfall of the month was 10·8 inches above the average at Tavoy and 7·58 inches at Henzada. On the other hand there was a very large deficiency of 23·99 inches at Akyab.

The following table summarizes the chief features of the rainfall of the month :—

| DISTRICTS.                                 | Normal average rainfall of month. | Actual average in 1886. | Excess or defect in inches. | Excess or defect expressed as a percentage. |

*July.*—During the first nine days of the month, the Bombay current was somewhat feeble, and the Bay of Bengal current was above its normal intensity as measured by the surface air motion. Abundant rain fell during this period in the North-Western Provinces and Bengal. On the 10th a great increase occurred in the strength of the Bombay current, and heavy rain fell in the coast districts on the 11th, 12th, 13th and 14th, and moderate showers in the Central Provinces and Central India until the 14th. It gave a heavy burst of rain to the Berars and some parts of the Central Provinces on the 14th and 15th. During this period, from the 10th to the 16th, a small depression formed off the Orissa coast, and hung off the coast for upwards of a week without developing to any extent. On the 17th, when the depression at the centre probably did not exceed a sixth of an inch, it advanced across the Orissa coast, moved slowly through Chutia Nagpur on the 19th and 20th, and into the north-eastern district of the Central Provinces on the 21st and 22nd, and passed into Rajputana on the 23rd, where it gradually filled up. The weakness of the Bengal current at this time was shewn by the absence of development of the storm at the head of Bay, and by the extreme slowness of its motion. As soon as it passed into Chutia Nagpur, the westerly winds of the Bombay current, which had been blowing strongly for several days, began to feed into it, and very heavy rain fell in the Central Provinces and Central India to the west of the depression, whilst very moderate rain was received in the districts to the east and north of its path. After its disappearance on the 24th, the rainfall diminished rapidly in the interior and was confined chiefly to light local showers. Heavy rain continued to fall in the Malabar coast districts, and a considerable influx of vapour was carried across the Bengal coast into the interior. Heavy rain fell in Bengal on the 25th, and extended to Behar and the eastern districts of the North-Western Provinces on the 26th. A very heavy burst of rain, probably due mainly to the same action, was received at the hill stations and adjacent plains districts of Upper India on the 27th. During the remainder of the month rain was general and heavy over the North-Western Provinces, Behar, Bengal, Assam and the north-eastern districts of the Central Provinces.

In the Punjab the rainfall of the month was very considerably in excess. The eastern and southern districts received heavy rain on the 3rd and 4th. Hoshiarpur registered 9'75 inches on the 3rd. General rain fell throughout the province from the 11th to the 16th, and also on the 27th, and occasional showers in the intervals between these periods. The rainfall during the month was mainly determined to the south-eastern districts, in which nearly all the large amounts were registered. The total rainfall

of the month was above the normal in all except the most northern districts. It was only at the hill stations and in the south-eastern districts that the excess was considerable. The following are the more important variations :—

|                      | Total rainfall.<br>August 1886. | Normal rainfall.<br>August. | Excess. |
|----------------------|---------------------------------|-----------------------------|---------|
| Hoshiarpur . . . . . | 17'25                           | 10'18                       | 7'07    |
| Gurdaspur . . . . .  | 18'80                           | 9'90                        | 8'90    |
| Amritsar . . . . .   | 13'60                           | 8'52                        | 5'08    |
| Hissar . . . . .     | 10'30                           | 4'66                        | 5'64    |
| Rohtak . . . . .     | 10'90                           | 5'89                        | 5'01    |
| Ludhiana . . . . .   | 14'45                           | 9'74                        | 4'71    |
| Umballa . . . . .    | 15'00                           | 11'58                       | 3'42    |

In Rajputana showers were received from 1st to the 6th. A short break followed until the 12th, when the rains recommenced, and continued steadily throughout the remainder of the month. The rainfall of the month was in excess generally by considerable amounts, except in Merwara, Marwar and Ajmere, or the area represented by Ajmere, Nuseerabad, Beawar and Jodhpore, in which there was a largish deficiency exceeding three inches. Central India received rain on every day of the month, but the daily amounts registered were not large, except in the eastern districts during the passage of the cyclonic storm from the head of the Bay through it into Rajputana. Amongst the larger falls during that period were :—

| STATIONS.          | Day. | Rainfall in 24 hours. |
|--------------------|------|-----------------------|
| Maihar . . . . .   | 20th | 9'50 inches.          |
| Ramnagar . . . . . | 20th | 6'34 "                |
| Sutna . . . . .    | 21st | 5'17 "                |
| Nowgong . . . . .  | 21st | 4'24 "                |

The rainfall of the month was considerably in excess in the eastern districts, more especially at Maihar (+6'47 inches), Morar, (+5'54 inches), Sitlaha (+5'57 inches), and Sutna (+4'7 inches), and was in defect by similar amounts in the western districts. Thus the deficiency at Neemuch was 5'62 inches, at Rutlam 5'85 inches, and at Agar 4'98 inches.

In the North-Western Provinces rain fell generally during the greater part of the month. The only period during which there was an almost entire cessation was from the 13th to the 16th. The rainfall was very irregularly distributed, and was very largely determined to the eastern districts, partly by the peculiar or abnormal pressure conditions of the month, and partly by the influence of the cyclonic storm of the third week of the month. The 5th and 6th, the 27th, 28th and 29th formed the two periods of most general and heaviest rainfall. The largest amount recorded for any one day during the month was a fall of 6'01 inches at Agra on the 6th. The total rainfall of the month

was very considerably in defect in the western districts, as shewn by the following variations :—

| STATIONS,              | Total rainfall of month. | Defect.      |
|------------------------|--------------------------|--------------|
| Saharanpur . . . . .   | 6'30                     | 5'81 inches. |
| Bijnor . . . . .       | 7'19                     | 3'48 "       |
| Meerut . . . . .       | 6'15                     | 3'09 "       |
| Bulandshahr . . . . .  | 1'31                     | 7'24 "       |
| Bareilly . . . . .     | 11'62                    | 2'89 "       |
| Budaon . . . . .       | 8'63                     | 2'23 "       |
| Shahjehanpur . . . . . | 9'06                     | 3'16 "       |

These stations define the area of deficient rainfall during the month. All the districts to the east of that area, with the exception of Allahabad, Mirzapur, Hamirpur and Basti in the North-Western Provinces, and Lucknow, Hardoi, Fyzabad and Gonda in Oudh received amounts considerably in excess of the normal.

The area of most abundant rain in the North-Western Provinces during the month included the following stations:—

|                     | Total rainfall of month. | Excess.      |
|---------------------|--------------------------|--------------|
| Azamgarh . . . . .  | 20'27                    | 8'98 inches. |
| Jalaun . . . . .    | 19'20                    | 8'51 "       |
| Ghazipur . . . . .  | 19'11                    | 8'23 "       |
| Sultanpur . . . . . | 18'32                    | 6'03 "       |

In Orissa, Chutia Nagpur and South-West Bengal fairly general rain was received on every day of the month. In East and North Bengal and in Behar there was a partial break, extending from the 12th to the 17th, during which the small cyclonic storm was slowly developing at the head of the Bay. The periods of heaviest and most general rain throughout the province were from the 4th to the 8th and from the 20th to the end of the month. The more remarkable local falls during the month were 15'72 inches at Cox's Bazar on the 9th, 9'64 inches at Jalpaiguri on the 6th, 12'21 inches at Rangamatia on the 8th, and 8'27 inches at Gya on the 27th. The rainfall of the month was very unequally distributed. It was considerably over the average in Behar and the south-eastern districts of East Bengal. It was in excess to a small extent over the greater part of South and Central Bengal, and the coast districts of Orissa. It was slightly below it in the greater part of Chutia Nagpur, a large part of Orissa, and the greater part of North Bengal. The districts of most excessive rainfall are shewn by the following :—

|                  | Total rainfall of month. | Excess.       |
|------------------|--------------------------|---------------|
| Chupra . . . . . | 25'62                    | 14'90 inches. |
| Patna . . . . .  | 22'09                    | 11'06 "       |
| Gya . . . . .    | 20'66                    | 8'73 "        |
| Sarun . . . . .  | 21'56                    | 9'50 "        |

This determination of excessive rainfall to the central and southern districts of Behar, which was a very marked feature of the month of July, became even more prominent in the later months of the rains.

The following table shows the general character of the rainfall distribution of the month in Bengal :—

| DIVISIONS.                  | Average, 1886. | Normal average. | Variation. |
|-----------------------------|----------------|-----------------|------------|
| Orissa . . . . .            | 11'11          | 12'82           | —1'71      |
| South-West Bengal . . . . . | 14'72          | 11'74           | +2'98      |
| East Bengal . . . . .       | 19'26          | 16'35           | +2'91      |
| North Bengal . . . . .      | 15'13          | 14'33           | +0'80      |
| North Behar . . . . .       | 18'80          | 12'24           | +6'56      |
| South Behar . . . . .       | 16'05          | 11'93           | +4'12      |
| Chutia Nagpur . . . . .     | 11'23          | 13'51           | —2'28      |

In Assam the month was one of almost continuous rainfall, and the total amounts registered were in excess at all stations except Sibsagar, Dhubri and Cherra Poonjee. Silchar received 13'19 inches more than its normal amount, and the rainfall of the month was exceptionally heavy and continuous in the Cachar district. There were two periods of general and heavy rainfall, *viz.*, from the 3rd to the 7th and from the 19th to the 24th. During the first of these periods, lasting for five days, 60'7 inches were registered at Cherra Poonjee.

In the Central Provinces rain fell almost continuously from the 1st to the 23rd, when a short break lasting for three days intervened. During the remainder of the month rain again became more general, but was generally very moderate in amount, except on the 29th, when some heavy showers were received in the eastern districts. The 15th and 16th were the days of most general and heaviest rainfall during the month, and several amounts of three and four inches were recorded on that day. The variations of the total rainfall of the month from the normal varied very considerably. There was a considerable deficiency in the eastern districts represented by Raipur, Bilaspur and Wardha bordering on Chutia Nagpur, and also locally at Khandwa. In other districts the rainfall was above the average. This was more especially the case at Chikalda (where the excess was 10'89 inches, and Akola where it was 7'02 inches.)

In Hyderabad occasional showers were received until the 8th, when general rain commenced and continued until the 25th. A short and partial break ensued which lasted till the end of the month. No very large amounts were received, but the steady rainfall during the month gave total amounts very considerably in excess of the normal average, and averaging 2'52 inches for the whole district.

In Bombay, the rainfall was limited in amount and partial until the 7th, when a great increase occurred in the strength of the westerly winds on the Bombay coast. They blew very steadily and strongly during the remainder of the month, and gave rainfall very largely in excess of the normal amount in every part of the Presidency, except the Satara and Poona districts. Amongst the heaviest and most noteworthy rainfalls due to this vast influx were—

| Stations.              | Day. | Rainfall in 24 hours. |
|------------------------|------|-----------------------|
| Ratnagiri . . . . .    | 10th | 9'23 inches.          |
| Karwar . . . . .       | 10th | 8'90 „                |
| Mahableshwar . . . . . | 22nd | 10'75 „               |
| Dittó . . . . .        | 23rd | 9'85 „                |

The amount of the excess varied very largely in different parts of the Presidency. The following gives some of the more remarkable:—

|                     | Total<br>rainfall<br>of month. | Excess.       |
|---------------------|--------------------------------|---------------|
| Karwar . . . . .    | 61'92                          | 24'26 inches. |
| Ratnagiri . . . . . | 53'66                          | 20'04 „       |
| Honawar . . . . .   | 62'15                          | 19'14 „       |
| Vingurla . . . . .  | 51'58                          | 15'96 „       |
| Goa . . . . .       | 50'71                          | 17'64 „       |
| Bombay . . . . .    | 35'79                          | 11'12 „       |
| Rajkot . . . . .    | 23'74                          | 13'40 „       |

In Ganjam and the Circars rain fell on almost every day during the month. In the southern districts of the Madras Presidency light or moderate showers were received at frequent intervals. The total rainfall was above the average in the whole of Madras, as in Mysore and Coorg, by moderate amounts. The general character of this excess is briefly indicated by its value in the following cases:—

|                        | Total<br>rainfall. | Excess.      |
|------------------------|--------------------|--------------|
| Ganjam . . . . .       | 6'65               | 1'44 inches. |
| Vizagapatam . . . . .  | 7'50               | 2'68 „       |
| Kurnool . . . . .      | 7'50               | 2'43 „       |
| Cuddapah . . . . .     | 4'63               | 1'15 „       |
| Arcot . . . . .        | 5'98               | 2'52 „       |
| Madras . . . . .       | 5'61               | 1'82 „       |
| Tranquebar . . . . .   | 5'75               | 3'65 „       |
| Tanjore . . . . .      | 6'45               | 4'53 „       |
| Trichinopoly . . . . . | 6'19               | 4'03 „       |
| Madura . . . . .       | 6'36               | 4'67 „       |

The rainfall of the month was also in excess by similar amounts in Ceylon. The largest variation occurred at Galle, where the total was 5'78 inches above the normal rainfall of the month.

Burma and Arakan received almost continuous rain during the month, but there was a moderate deficiency varying from five to twenty per cent., except at Akyab, where it amounted to 11'69 inches, or nearly 25 per cent. of the average fall of the month.

The following table summarizes the chief features of the rainfall of the month:—

| DISTRICTS.                                 | Normal average<br>rainfall of<br>month. | Actual average<br>in 1886. | Excess or defect<br>in inches. | Excess or defect<br>expressed as a<br>percentage. |
|--------------------------------------------|-----------------------------------------|----------------------------|--------------------------------|---------------------------------------------------|
| Western Himalayas . . . . .                | 14'91                                   | 15'24                      | +0'33                          | + 2                                               |
| Punjab Plains . . . . .                    | 6'27                                    | 8'47                       | +2'20                          | +35                                               |
| North-Western Provinces and Oudh . . . . . | 11'75                                   | 12'03                      | +0'28                          | + 2                                               |
| Rajputana . . . . .                        | 7'45                                    | 8'67                       | +1'22                          | +16                                               |
| Central India States . . . . .             | 14'39                                   | 15'25                      | +0'86                          | + 6                                               |
| Behar . . . . .                            | 11'66                                   | 18'05                      | +6'39                          | +55                                               |
| Western Bengal & Chutia Nagpur . . . . .   | 13'03                                   | 13'19                      | +0'16                          | + 1                                               |

| DISTRICTS.                            | Normal average<br>rainfall of<br>month. | Actual average<br>in 1886. | Excess or defect<br>in inches. | Excess or defect<br>expressed as a<br>percentage. |

*August.*—An almost complete break in the rains obtained in Western and Central India at the commencement of the month. Rain on the other hand fell steadily in Northern India from the 1st to the 5th, after which it decreased rapidly in amount. From the 5th to the 10th the break in the rains became more and more general, and on the 10th practically extended over the whole of India. The winds on the west coast began to strengthen on the 11th, and gave increasing amounts of rain. A small whirl of a very unusual character appeared off the coast of the Circars, and drifted slowly northwards in the neighbourhood of the coast. Rain increased steadily on the west coast and the Deccan, whilst the small whirl continued its northward march. It finally crossed the coast between False Point and Gopalpur on the morning of the 18th. It then advanced to the north-west, and caused a considerably increased influx of winds from the Arabian Sea. The rainfall over the west coast districts, the Deccan and Central Provinces, on the 19th and 20th was consequently large. The storm filled up on the 21st in Bundelkund and Central India, but heavy rain fell on that day over a large part of Central India and the Central Provinces. During the remainder of the month the Bombay current was weak; but the Bengal current, after some slight irregular cyclonic action in South Bengal on the 23rd and 24th, blew steadily up the Gangetic plain, and gave general and moderate rain on the 25th, 26th and 27th to Northern India. The current then weakened, and the rainfall

diminished rapidly in amount, so that at the end of August an almost complete break in the rains again obtained over the whole of India.

During the month of August, showers more or less local in character occurred in the Punjab, but there was an entire absence of heavy general rain. The rainfall of the month was very largely below the average. The deficiency increased in amount from north and west to south and east and reached a maximum in the Gurgaon district. The rainfall at the head-quarter station of that district was only 1·10 inches or 5·71 inches below the average.

In Rajputana the south-western districts received general and daily rain throughout the month, except during a short break extending from the 10th to 15th. Central and North Rajputana had a heavy burst of rain in common with the southern districts from the 18th to the 22nd, due to the passage of the storm described above from the Bay of Bengal. Showers were also received on the 28th, 29th and 31st, but during the remainder of the month little or no rain fell. Some large amounts were recorded on the 20th and 21st, amongst which the more noteworthy were:—

|                    |                          |
|--------------------|--------------------------|
| Banswara . . . . . | 6·61 inches on the 21st. |
| Sambhar . . . . .  | 6·45 ditto.              |
| Tonk . . . . .     | 6·14 ditto.              |
| Erinpura . . . . . | 5·58 ditto.              |

The rainfall of the month was above the average except in Ulwur, Bhurtpore, Ajmere and Bickaneer. The deficiency was small except at Ulwur, where it amounted to 6·87 inches. There was a considerable excess in the southern and western districts, more especially at Odeypore (6·64 inches), Banswara (5·85 inches), and Partabgarh (5·95 inches).

In the North-Western Provinces the rainfall was very irregularly distributed. Heavy general rain was received during the first four days of the month. An almost entire break then commenced, and lasted until the 14th, after which occasional showers fell for some days. From the 23rd to the 28th was a period of heavy general rain over the whole province. The rainfall of the month was above the average in all districts except the more eastern, including Allahabad, Hamirpur, Benares, Banda, Jalaun, Fatehpur and Lucknow. The variations were however comparatively small, except in the following cases where the rainfall was very largely in excess:—

|                        | Normal<br>rainfall, August. | Actual<br>rainfall, August<br>1886. | Excess. |
|------------------------|-----------------------------|-------------------------------------|---------|
| Bulandshahr . . . . .  | 7·01                        | 18·40                               | 11·39   |
| Budaun . . . . .       | 8·62                        | 20·91                               | 12·29   |
| Shahjehanpur . . . . . | 9·24                        | 19·13                               | 9·89    |
| Moradabad . . . . .    | 9·94                        | 18·85                               | 8·91    |
| Naini Tal . . . . .    | 25·03                       | 48·40                               | 23·37   |

The month was one of heavy and almost incessant rain in Bengal. From the 7th to the 21st there was a partial break in Behar, during which weather was fine with light occasional showers. The rainfall was however very irregularly distributed. There was as in the preceding month a marked determination of aqueous vapour condensation to Behar,

and the rainfall in that area was largely in excess. It was generally in defect in Chutia Nagpur and Orissa, but the variations were small, and of no great importance except at Chyebassa, in Singhbhum, which barely received half its normal amount. The rainfall was excessive over the whole of Bengal, with the exception of the 24-Pergunnahs, Burdwan and Midnapore, where there was a slight local deficiency.

The excess was largest in East and North Bengal and in North Behar, and exceeded 10 inches at Chittagong (13·2 inches), Kishoreganj (14·95 inches), Kissengunge (13·68 inches), Baxa (22·4 inches), Darjeeling (10·93 inches), and Purneah (13·62 inches).

The following table gives the distribution and variation in the various divisions of Bengal:—

| Divisions.                  | Average, 1885. | Normal average. | Variation. |
|-----------------------------|----------------|-----------------|------------|
| Orissa . . . . .            | 9·37           | 11·43           | —2·06      |
| South-West Bengal . . . . . | 11·71          | 13·03           | —1·32      |
| East Bengal . . . . .       | 21·38          | 15·58           | +5·80      |
| North Bengal . . . . .      | 15·82          | 14·05           | +1·77      |
| North Behar . . . . .       | 17·81          | 11·11           | +6·70      |
| South Behar . . . . .       | 12·33          | 11·35           | +0·98      |
| Chutia Nagpur . . . . .     | 10·82          | 13·50           | —2·68      |

The first ten days of the month formed a period of continuous and heavy rain in Assam. On three days during this period Cherra Poonjee received rainfalls exceeding 10 inches, *viz.*, 19·7 inches on the 5th, 17·43 inches on the 8th, and 14·35 inches on the 10th. Almost daily showers were received during the remainder of the month. In the Garo and Khasia hills and the Silchar districts the rainfall was unusually abundant. Cherra Poonjee received an excess of 39·32 inches, and Sylhet of 15·92 inches. In the Assam valley, the variations were small and compensatory, and the rainfall of the month normal in amount.

In the Central Provinces frequent showers fell throughout the month, but they were generally very light, and rarely exceeded four or five-tenths of an inch. There was a partial break from the 6th to the 11th, which was more marked and complete in the Berars than in the Central Provinces. The total rainfall of the month was very considerably in defect in all parts of the province except Sironcha. Amongst the larger deficiencies were—

|                       | Inches. |                    | Inches. |
|-----------------------|---------|--------------------|---------|
| Jubbulpore . . . . .  | 6·52    | Bilaspur . . . . . | 5·47    |
| Hoshangabad . . . . . | 6·57    | Raipur . . . . .   | 8·12    |
| Seoni . . . . .       | 5·48    |                    |         |

Hyderabad received very heavy general rainfall. An unusually heavy downpour of rain occurred during the period, extending from the 13th to the 20th. Amongst the more remarkable falls were:—

|                     | Inches.           |
|---------------------|-------------------|
| Indur . . . . .     | 8·10 on the 16th. |
| Yelgandal . . . . . | 6·67 „ 16th.      |
| Ditto . . . . .     | 5·20 „ 17th.      |

This rainfall occurred immediately after the great increase of the strength of the Bombay current and of rainfall on the west coast, which began on the 12th. The total

rainfall was largely in excess with one or two exceptions. The excess was greatest at Indur, for which it was 10·24 inches and averaged 3·13 inches for the whole division.

The Bombay current was unusually light at the commencement of the month and gave occasional feeble showers, chiefly in the coast districts. It strengthened considerably on the 12th, and gave general and daily rain during the remainder of the month. The amounts were however generally smaller than usual, and the rainfall of the month was hence in defect at the great majority of stations. The deficiency was largest in the Konkan and adjacent Deccan districts. At Honawar it was 9·31 inches, at Igatpuri 7·99 inches, at Tanna 7·09 inches, at Belgaum 4·79 inches, at Bombay 4·39 inches, and at Satara 4·08 inches.

Madras, Ganjam and the Circars received very frequent showers during the whole month, and a heavy burst from the 15th to the 19th. In the southern districts of the Peninsula showers were of frequent occurrence until the 17th or 18th, when a break in the rains commenced and lasted until the end of the month, with the exception of the 27th and 28th, when some showers fell, chiefly in the central districts. The rainfall of the month was in excess in all districts except the Travancore and Cochin coast districts, where it was nearly as deficient as further north on the Konkan coast. It would thus appear that in consequence of some unknown abnormal conditions, the vapour brought up from the Arabian sea by the Bombay monsoon winds was less largely condensed in the coast districts than usual, and more largely in the East Deccan, Hyderabad and Madras, so that these latter districts received unusually copious supplies of rain. Amongst the more noteworthy rainfalls of the month were:—

| STATIONS.              | Total rainfall,<br>August 1886. | Variation. |
|------------------------|---------------------------------|------------|
|                        | Inches.                         | Inches.    |
| Vizianagram . . . . .  | 17·15                           | + 10·56    |
| Masulipatam . . . . .  | 19·93                           | + 13·90    |
| Cuddalore . . . . .    | 13·89                           | + 8·80     |
| Kumbakonam . . . . .   | 15·05                           | + 10·24    |
| Negapatam . . . . .    | 10·34                           | + 6·93     |
| Arcot . . . . .        | 10·32                           | + 4·29     |
| Trichinopoly . . . . . | 7·60                            | + 3·23     |
| Madura . . . . .       | 5·86                            | + 1·21     |
| Calicut . . . . .      | 4·90                            | — 8·41     |
| Mangalore . . . . .    | 11·17                           | — 11·91    |

Mysore and Coorg received slightly less than their normal amounts except at one or two stations, including Bangalore and Tumbur.

In Ceylon the rainfall of the month was generally favourable and above the average to a small extent.

In Burma rain fell daily, but was irregularly distributed. The total rainfall of the month was slightly above the average in Tenasserim and at Kyaukpyu, and considerably above it at Toungoo and Shwegyin (10·17 inches), but was below it at other stations. The deficiency slightly exceeded 5 inches at Akyab, Sandoway and Henzada.

The following table summarizes the chief features of the rainfall of the month :—

| DISTRICTS.                                 | Normal average<br>rainfall of<br>month. | Actual average<br>in 1886. | Excess or defect<br>in inches. | Excess or defect<br>expressed as a<br>percentage. |

*September.*—Both currents were weak at the commencement of the month. The Bengal current strengthened again on the 4th and 5th of the month. During the remainder of the month a special feature, which had hitherto been masked by other actions, came into prominence. This was the tendency to the formation of areas of low pressure in the eastern districts of the North-Western Provinces and in South and Central Behar. This accompanied an even stronger determination of the aqueous vapour of the Bengal current than hitherto to Behar, and the occurrence of abnormally heavy rainfall in Behar and the adjacent districts of the North-Western Provinces. The first occasion was on

the 5th and 6th in the eastern districts of the North-Western Provinces. The second was on the 8th, 9th, 10th, and 11th, when a very clearly marked and purely land-formed depression covered Central and South Behar. The depression was practically stationary during the whole period of its existence, and gave excessively heavy rain and floods, more especially in South Behar.

A small depression formed in the north-west angle of the Bay on the 15th, and passed northwards into Chutia Nagpur on the 16th and 17th; a second appeared on the 18th in the same part of the Bay, and unlike the previous was nearly stationary until the 21st, when it advanced across the coast through Chutia Nagpur on the 22nd into South Behar on the 23rd, and gave very heavy rain on that day and the 24th in some parts of Central Behar.

After its disappearance on the 25th a complete break in the rains was established over the whole of India during the next three days. A depression then began to form off the coast of Ganjam and the Circars which caused the reversion of the south-west current, and the north-easterly and easterly winds thus produced gave heavy rain in the coast districts of South-West Bengal and Orissa until the end of the month.

In the Punjab a few light showers fell during the first week of the month, but from that date till the end of the month no rain was received except at the hill stations. Hence the month was exceptionally dry, and the rainfall seriously in defect at all stations. The deficiency increased from one inch in the western districts to three and four inches in the south-eastern districts (Delhi, Gurgaon and Kurnal.)

In Rajputana showers, in some cases heavy, were received between the 1st and 5th of the month, after which clear dry weather set in and continued to the end of the month. The deficiency in the total rainfall of the month was even more marked than in the Punjab, and varied from one to eight inches in amount.

In the western districts of Central India rain fell until the 4th of the month, and the total amounts were hence even more largely in defect than in Rajputana. The eastern districts shared partially in the heavy rainfall of the second week of the month, which was determined mainly to Behar and the eastern districts of the North-Western Provinces: the rainfall of the month was hence either normal or slightly in excess. The following table contrasts the variations in the eastern and western districts:—

|                   |   |          |   |   |   | Variation from average. |
|-------------------|---|----------|---|---|---|-------------------------|
| WESTERN DISTRICTS | { | Neemuch  | . | . | . | —4'37 inches.           |
|                   |   | Rutlam   | . | . | . | —5'65 "                 |
|                   |   | Indore   | . | . | . | —7'48 "                 |
|                   |   | Bhopal   | . | . | . | —8'03 "                 |
| EASTERN DISTRICTS | { | Ramnagar | . | . | . | +2'09 "                 |
|                   |   | Sitlaha  | . | . | . | +2'23 "                 |
|                   |   | Sutna    | . | . | . | +0'22 "                 |

The rainfall in the North-Western Provinces was also considerably below its normal amount with few exceptions. Showers fell on the first four days. This was followed by heavy rain on the 5th and 6th, after which the rainfall was very limited in amount and confined to light showers, which were received chiefly on the eastern districts. The rains practically ceased on the 14th in the western districts and Oudh, and on the 17th in the eastern districts. The deficiency was less pronounced than in the Punjab or Central India. Several

stations which received heavy rain on the 5th and 6th showed a moderate excess. The following gives a general view of the deficiency :—

|                       | Total rainfall of month. | Defect.      |
|-----------------------|--------------------------|--------------|
| Roorkee . . . . .     | 1'23                     | 3'83 inches. |
| Meerut . . . . .      | 3'47                     | 0'52 "       |
| Bulandshahr . . . . . | 0'50                     | 3'60 "       |
| Agra . . . . .        | 1'61                     | 2'71 "       |
| Cawnpore . . . . .    | 1'75                     | 3'07 "       |
| Gorakhpur . . . . .   | 5'07                     | 3'76 "       |
| Mirzapur . . . . .    | 4'87                     | 2'02 "       |
| Fyzabad . . . . .     | 1'73                     | 6'16 "       |

The chief centres of larger rainfall than usual were Jalaun (+6'28 inches), Lucknow (+3'11 inches), Jaunpur (+3'75 inches), Budaun (+5'16 inches), Aligarh (+3'05 inches), and Shahjehanpur (+2'56 inches).

In Bengal and Orissa rain fell in larger or smaller quantities throughout the whole month. Little rain fell in Behar from the 1st to the 4th and from the 25th to the end of the month. The periods of most general and heaviest rain were from the 5th to the 10th and from the 13th to the 23rd. The total rainfall of the month was largely above the average in Behar (more especially the southern districts), the northern and central districts of Chutia Nagpur, Orissa, and the whole of Northern and Central Bengal. There was generally a slight excess in the southern and eastern districts. The following table illustrates the previous statement :—

|                      | Total rainfall of Sept. 1886. | Excess.       |
|----------------------|-------------------------------|---------------|
| Monghyr . . . . .    | 21'67                         | 13'23 inches. |
| Bhagalpur . . . . .  | 25'61                         | 17'80 "       |
| Nya Doomka . . . . . | 21'85                         | 11'15 "       |
| Jalpaiguri . . . . . | 35'90                         | 11'61 "       |
| Kissengunj . . . . . | 29'57                         | 15'31 "       |
| Maldah . . . . .     | 20'83                         | 9'98 "        |
| Gya . . . . .        | 16'86                         | 9'82 "        |

The variations of the rainfall in Bengal from the normal are shown by the following data extracted from the Bengal monthly report for September 1886 :—

| DIVISIONS.                  | Average rainfall, September 1886. | Normal average rainfall, September. | Variation. |
|-----------------------------|-----------------------------------|-------------------------------------|------------|
| Orissa . . . . .            | 15'75                             | 10'47                               | +5'28      |
| South-West Bengal . . . . . | 12'48                             | 8'90                                | +3'58      |
| East Bengal . . . . .       | 13'46                             | 12'46                               | +1'00      |
| North Bengal . . . . .      | 22'29                             | 12'72                               | +9'57      |
| North Behar . . . . .       | 13'82                             | 9'73                                | +4'09      |
| South Behar . . . . .       | 16'59                             | 7'26                                | +9'33      |
| Chutia Nagpur . . . . .     | 11'62                             | 8'66                                | +2'96      |

In Assam and Cachar there was rain daily. The total rainfall was slightly in defect at Sibsagar and the hill stations. There was a large excess in Silchar, and also in the eastern and central districts of the Assam valley. The rainfall of the month at Silchar was 12'02 inches in excess and at Nowgong 9'26 inches.

Showers fell throughout the Central Provinces and Berars until the 5th or 6th of the month. With the exception of some showers which fell chiefly on the 13th, 14th, 15th, and 16th in the Sambalpur, Raipur, Bilaspore and Nagpur districts, the remainder of the month was rainless and the weather unusually dry and hot. The rainfall of the month was hence very largely in defect, except in the Sambalpur and Raipur districts, where it was slightly above the average. The deficiency varied from 5 to 7 inches over nearly the whole of the remainder of the province, and was absolutely greatest at Pachmarhi (12·37 inches) and Hoshangabad (9·39 inches).

In Hyderabad light showers were received at intervals until the 21st. There was only one day of general rain, *viz.*, the 2nd, on which falls exceeding three inches were received at several stations. The rainfall of the month was almost universally in defect by amounts varying from 1 to 6 inches.

The rainfall in the Bombay Presidency was similar in character to that of the Central Provinces and Hyderabad but larger in amount. Frequent showers occurred in the coast districts, and occasional showers in the Deccan districts during the month. There was however no general or heavy burst of rain, and the total rainfall of the month was hence largely in defect. A few showers fell from the 1st to the 4th in Sind and Guzerat, after which the weather was dry and clear. The variations differed very largely in the coast and interior districts. The following give some of the more striking :—

|                     | Total rainfall<br>of month. | Deficiency. | Percentage<br>deficiency. |
|---------------------|-----------------------------|-------------|---------------------------|
| Baura . . . . .     | 11·17                       | 23·40       | 68                        |
| Lanauli . . . . .   | 8·64                        | 15·14       | 64                        |
| Matheran . . . . .  | 14·38                       | 16·62       | 54                        |
| Honawar . . . . .   | 4·77                        | 10·57       | 69                        |
| Ratnagiri . . . . . | 3·41                        | 9·42        | 73                        |

The Ganjam district of Madras received frequent heavy showers during the month; but over nearly the whole Presidency, with that exception, the rainfall was of the same irregularly distributed character as in the Deccan and Hyderabad. The southern districts received frequent showers during the first ten days of the month, and again after a longish interval of fine weather from the 21st to the 28th.

The rainfall of the month was in excess to a moderate amount in Ganjam. It was below the average in all the northern and central districts of Madras and in Travancore and Malabar with one or two unimportant exceptions, but was above the average in the southern districts, including Negapatam, Tanjore, Coimbatore, Madura, Tinnevely. The excess was greatest at Madura, which received 7·46 inches more than its normal amount. Mysore and Coorg also shared in the larger rainfall of Southern India, and received from two to

five inches in excess of the average. The rainfall of Ceylon was also above the normal by moderate amounts, averaging 2·2 inches for the whole island.

The month was one of frequent and almost daily rain in Burma. The total fall varied very slightly from the normal, except locally at Moulmein, where there was a very large deficiency of 14·5 inches, and Sandoway, where there was a deficiency of 7·03 inches.

The following table summarizes the chief features of the rainfall of the month :—

| DISTRICTS.                                 | Normal average rain-fall of month. | Actual average in 1886. | Excess or defect in inches. | Excess or defect expressed as a percentage. |

*October.*—The meteorological conditions of the month of October were very abnormal. In the first week of the month there was a marked tendency to persistent barometric depression across the peninsula from Poona and Belgaum to Masulipatam and Vizagapatam and in the adjacent portion of the Bay. The depression from the 1st to the

5th was most prominent in the centre of the peninsula, and the cyclonic circulation accompanying it gave moderate rain during that period and until the 8th to the Deccan, Central Provinces, North Madras, Orissa, Bengal, Behar, Chutia Nagpur and the eastern districts of the North-Western Provinces. On the 7th and 8th the depression lay over that portion of the Bay in the immediate neighbourhood of the coast of Ganjam and the Circars. It intensified slightly, and gave very squally winds along the west coast, but never developed into a large cyclonic storm. Its motion was utterly different from the ordinary storms of the month in the Bay. It advanced very slowly southwards along the coast. On the 11th and 12th it lay off the coast, between Masulipatam and Madras, and on the 13th and 14th off the coast from Masulipatam to Negapatam, after which it either passed westwards or filled up and disappeared. During its existence the indraught across the Malabar coast to the southern quadrant gave frequent showers to Southern India, whilst the easterly and north-easterly winds in the northern quadrant gave moderately heavy rain to the north-west coast of the Bay, the area of heaviest rainfall advancing southwards with the southward march of the depression.

An almost complete break in the rains followed during the next two days, whilst a small storm was forming to the north-west of the Andamans. It marched in a west-north-west direction, and struck the coast between Vizagapatam and Cocanada on the 19th, advanced into the North Deccan on the 20th, and filled up on the evening of that day. It gave heavy rain to a portion of the Circars, and light to moderate rain in the North Deccan and southern districts of the Central Provinces. The disappearance of the storm was followed by fine weather for several days until the end of the month, during which some local showers were received, chiefly in Southern India, the western districts of the Central Provinces, the Berars, and South Bengal. The general tendency during this interval was for rainfall to increase slightly in Southern India, whilst it gradually diminished in South Bengal and the North Deccan, where it was practically nil at the end of the month.

In the Punjab rather heavy showers fell in the eastern and southern districts on the 6th and 7th, which gave a rainfall slightly exceeding the normal average rainfall of the month. The remainder of the month was practically rainless.

In Rajputana a few showers fell on the 3rd and 4th, and fairly general rain on the 21st and 22nd. This rainfall was somewhat unusual in character, and gave a total for the month which was from one to four inches above the normal in the southern and south-western districts.

Central India received general rain from the 1st to the 7th and light showers from the 15th to the 28th. Many of the showers, especially on the 3rd and 4th, were unusually heavy. Nowgong received 2.5 inches on the 3rd and Chandia 3.32 inches on the 4th. The total rainfall of the month was hence above the average at all stations, the excess varying from .87 inch at Agar to 5 inches at Sutna, Chandia, Sirdarpore and Sihawal, and 6 inches at Rutlam.

The North-Western Provinces and Oudh obtained a general and heavier burst of rain during the first week of the month than is usual in Upper India in October. It lasted from the 3rd to the 7th. Basti received 4.67 inches on the 3rd, Ballia 3.84 inches and Benares 3.07 inches on the 4th, Jaunpur 4.5 inches and Azamgarh 3.5 inches on the 5th, Mirzapur 2.83 inches on the 6th, and Jaunpur 2.7 inches on the 7th. The rainfall was heaviest in the more eastern districts of the North-Western Provinces, and was compara-

tively light in North Oudh and the western districts of the North-Western Provinces. The rainfall of the month was hence slightly in defect in the districts to the west of the meridian of Etawah and over the northern districts of Oudh. In the southern districts of Oudh and the eastern districts of the North-Western Provinces there was a very considerable excess, of which the following are the more striking cases:—

|                            | Total rainfall. | Average. | Excess.      |
|----------------------------|-----------------|----------|--------------|
| Ballia . . . . .           | 12'30           | 3'77     | 8'53 inches. |
| Gorakhpur . . . . .        | 9'73            | 3'01     | 6'72 „       |
| Jaunpur . . . . .          | 8'04            | 3'00     | 5'04 „       |
| Basti . . . . .            | 6'92            | 2'39     | 4'53 „       |
| Sultanpur (Oudh) . . . . . | 6'93            | 1'87     | 5'06 „       |

In Bengal, Behar, Orissa and Chutia Nagpur there was fairly general rain, which in Bengal accompanied frequent thunderstorms during the first ten days of the month. The rainfall of this period was especially heavy and general in Central and South Behar, an average of one to two inches falling daily at several stations between the 3rd and 7th. Occasional showers of comparatively little importance occurred until the 18th in Behar and in Bengal until the end of the month (with the exception of a fairly well marked break lasting from the 13th to the 20th). Orissa and Chutia Nagpur obtained fairly general rain during the first week of the month, and frequent showers during the remaining three weeks. The distribution of the rainfall of the month was hence very unusual. Behar, Chutia Nagpur and Orissa received abundant rain. At Chupra the rainfall of the month was 9'27 inches in excess, at Arrah 8'53 inches, at Hazaribagh 8'47 inches, and at Cuttack 6 inches. On the other hand there was a deficiency in nearly every district in Bengal. The deficiency was small in South-West Bengal, but increased in amount northwards and eastwards, and in North and East Bengal it generally varied from one to five inches. The following gives the more important data of the distribution of rainfall in Bengal for the month:—

| DIVISIONS.                  | Average rainfall.<br>October 1886. | Normal average.<br>October. | Variation. |
|-----------------------------|------------------------------------|-----------------------------|------------|
| Orissa . . . . .            | 7'25                               | 6'13                        | +1'12      |
| South-West Bengal . . . . . | 3'94                               | 4'48                        | —0'54      |
| East Bengal . . . . .       | 3'61                               | 5'64                        | —2'03      |
| North Bengal . . . . .      | 2'74                               | 4'89                        | —2'15      |
| North Behar . . . . .       | 5'31                               | 3'40                        | +1'91      |
| South Behar . . . . .       | 6'74                               | 3'10                        | +3'64      |
| Chutia Nagpur . . . . .     | 8'47                               | 2'72                        | +5'75      |

The rainfall of the month in Assam was considerably below the average, except at Shibsagar, Nowgong and Tezpur, where there was a slight excess. In the eastern districts the deficiency slightly exceeded 3 inches and at Silchar nearly 5 inches. Light local showers occurred at frequent intervals between the 1st and 10th, and also between the 22nd and 26th and on the 30th and 31st.

In the Central Provinces and Berars general rain fell during the first six days of the month. This was followed by an interval of fine clear dry weather lasting until the 14th,

when a period of showery weather commenced, which continued until the end of the month. Some unusually heavy showers were received during the latter period. For example, Arvi recorded 5·75 inches on the 17th, and Ellichpur 6·50 inches on the 17th and 18th. The rainfall of the month, though somewhat irregularly distributed, was very largely in excess at the great majority of the reporting stations.

The following are the more striking examples:—

| STATIONS.               |                     | Total rainfall,<br>October 1886. | Normal rainfall,<br>October. | Excess. |

Hyderabad received as abundant a supply as the Central Provinces. Frequent showers occurred during the first eleven days. This was followed by a heavy general burst of rainfall, which lasted until the 16th, an average of over an inch falling on each day. From the 18th to the 28th frequent showers fell, but rain ceased on the evening of the day, and dry weather with clear skies prevailed on the three last days of the month. The excess varied from '58 inch at Ibrahimpatan to 7·82 inches at Bheer, and averaged 3'72 inches.

In the Bombay, Deccan, and the Malabar coast districts, the rainfall of the month occurred under similar conditions, and during the same periods as in Hyderabad, and some unusually heavy falls were registered. In the Konkan and Guzerat districts, heavy showers fell during the first week of the month, and occasional light showers between the 14th and 25th. The month was practically rainless in Sind. The total rainfall of the month was in excess in all districts except Sind and Cutch. The excess was on the whole greatest in the Deccan districts, the following being the most notable examples:—

| STATIONS.            | Total.           | Average.         | Excess.          |
|----------------------|------------------|------------------|------------------|
| Baura . . . . .      | Inches.<br>22'21 | Inches.<br>11'07 | Inches.<br>11'14 |
| Igatpuri . . . . .   | 13'08            | 4'91             | 8'17             |
| Poona . . . . .      | 11'86            | 4'12             | 7'74             |
| Ahmednagar . . . . . | 10'33            | 3'29             | 7'04             |
| Vingurla . . . . .   | 11'98            | 4'40             | 7'58             |
| Tanna . . . . .      | 10'72            | 3'35             | 7'37             |
| Matheran . . . . .   | 12'63            | 5'30             | 7'33             |

In Madras the rainfall during the first half of the month was given chiefly to the northern districts, including Ganjam, the Circars and the Kurnool district. The rainfall

was exceptionally heavy and continuous in the Northern Circars and Ganjam. Vizagapatam received 5·9 inches on the 15th, Ganjam 6 inches on the 11th, Ongole 4·7 inches on the 10th, Gopalpur 3·85 inches on the 11th, Bimlipatam 5·3 inches on the 18th, and Kurnool 3·62 inches on the 10th. During this period occasional showers were received in the southern districts, the total amounts diminishing southwards. The Madura, Tinnevely, Coimbatore, and Trichinopoly districts obtained not more than three to five-tenths of an inch during the whole period. The conditions changed during the third week of the month, and the north-easterly winds from the Bay chiefly discharged rain in the southern districts. The rainfall during the latter half of the month was however much less copious than during the first fortnight. In consequence of this unequal distribution, the rainfall was very largely in excess in the northern districts, and was more or less in defect over the whole of the southern districts. The following shows the marked contrast between the rainfall of the northern and southern districts:—

| Stations in Northern Districts. | Excess inches. | Stations in Southern Districts. | Defect inches. |
|---------------------------------|----------------|---------------------------------|----------------|
| Vizagapatam . . . .             | 18·71          | Trichinopoly . . . .            | 4·34           |
| Ganjam . . . . .                | 11·65          | Coimbatore . . . . .            | 4·32           |
| Ongole . . . . .                | 11·39          | Dindigul . . . . .              | 4·63           |
| Gopalpur . . . . .              | 11·29          | Madura . . . . .                | 3·99           |
| Cocanada . . . . .              | 10·23          |                                 |                |
| Bimlipatam . . . . .            | 10·22          |                                 |                |
| Rajahmundry . . . . .           | 10·06          |                                 |                |

Mysore and Coorg obtained rain during the same periods as the southern districts of Madras, and the total rainfall of the month was in defect by moderate amounts at all stations except Mercara, where it was 3·94 inches in excess.

Burma received more or less frequent showers during the month. The only period of heavy and general rain was on the 19th and 20th, when exceptionally heavy rain was received at many stations, the following being the more remarkable amounts:—

|                    |                          |
|--------------------|--------------------------|
| Kyaukpyu . . . . . | 9·38 inches on the 19th. |
| Rangoon . . . . .  | 5·26   "   "   "         |
| Moulmein . . . . . | 5·78   "   "   "         |
| Sandoway . . . . . | 7·74   "   "   20th.     |
| Akyab . . . . .    | 6·48   "   "   "         |

In Tenasserim rain fell on every day of the month except the 23rd and 26th. The total rainfall of the month was considerably in excess at those stations in Burma and Tenasserim, which received heavy rain on the 19th or 20th, and at Tavoy. It was in defect by small amounts at the remaining stations.

In Ceylon, the rainfall of the month was in defect as in the southern districts of Madras. The deficiency was largest in the north coast districts.

The following table summarizes the chief features of the rainfall of the month :—

| DISTRICTS.                                 | Normal average<br>rainfall of<br>month. | Actual average<br>in 1886. | Excess or defect<br>in inches. | Excess or defect<br>expressed as a<br>percentage. |

*November.*—The north-east monsoon was fully established during the preceding month. The recurved south-west monsoon current was feebler than in October, and gave much less than the normal amount of rain to Southern India. A large portion of the rainfall occurred during the existence of two cyclonic storms which formed in the Bay and advanced in a west-north-west direction. The first struck the coast a little to the north of Madras on the 9th, crossed the Peninsula, and passed into the Arabian Sea on the evening of the 10th. It advanced by a curved path across the Arabian Sea to the Beluchistan coast, which it reached on the morning of the 16th. It gave general rain to the greater part of Southern India and the Deccan on the 9th, 10th and 11th, and also a few light showers in Sind and Guzerat on the 16th, when approaching and crossing the Beluchistan coast.

The second was a very small but fierce and concentrated storm which reached the coast of the Circars on the evening of the 23rd near and to the north of Cocanada. It gave a very heavy burst of rain to the coast districts between Gopalpur and Cocanada, but broke up shortly after reaching the coast. There was subsequent slight general disturbance in Orissa, Chutia Nagpur and Behar, and the eastern districts of the Central Provinces, lasting from the 24th to the 26th.

No rain, with the exception of one or two light local showers of absolutely no importance, was received during the month in the Punjab, Rajputana, Central India, the North-Western Provinces and Oudh.

In Bengal, some showers fell during the generation of the first storm in East Bengal on the 8th, 9th and 10th, and, after its passage across the Deccan, in North Bengal from the 13th to the 15th. Orissa received light showers on the 8th, 9th and 10th during the passage of the Madras storm across the Bay and the Deccan, and also on the 23rd and 24th, during and after the approach of the Cocanada storm to the coast. Showers fell in Chutia Nagpur on the 25th and 26th, and in Behar on the 25th. The rainfall of the month was from one to two inches in excess over the greater part of Orissa. It was very slightly in excess in Chutia Nagpur and in South Behar. It was below the average in all other districts. It was only in the south-eastern districts of Comillah, Noakhally, Chittagong and Burrisal that the defect exceeded one inch (by small amounts).

The eastern districts of the Central Provinces shared in the rainfall which followed the breaking-up of the Cocanada storm, and received an average of one inch on the 24th and 25th, three quarters of an inch above the average. No rain fell in the western districts or in the Berars.

In Hyderabad rain fell on the 9th and 10th, but the total was considerably less than the average of the month.

In Bombay, the Deccan districts received moderate rain on the 10th and 11th during the passage of the first cyclonic storm of the month across the Peninsula, and Sind light showers on the 16th and 17th. The total rainfall was below the average by small amounts, varying from one to nine-tenths, except locally at Lanauli, Poona, Mahableshwar, and in Sind, where the rainfall of the month was in excess to a small extent.

In Madras normal conditions prevailed during the first few days of the month. Moderately heavy rain fell on every day in all the districts to the south of Cuddapah (or of lat.  $15^{\circ}$  N). For example, 11.5 inches fell at Negapatam during the period from the 1st to the 5th, 11.1 inches at Tranquebar, 5.6 inches at Madras, 2.3 inches at Coimbatore, 1.95 inches at Tinnevely, .5 inch at Madura, and .3 inch at Salem. The rainfall at this time was hence heavy in the coast districts, and rapidly decreased from the coast into the interior. Little rain fell on the 7th or 8th, but the advance of the first storm of the month gave moderate general rain over the Presidency, and heavy rain at stations on and to the north of its line of march. The following amounts exceeding three inches were recorded during the storm:—

|                   | Rainfall on<br>the 9th. |                  | Rainfall on<br>the 9th. |
|-------------------|-------------------------|------------------|-------------------------|
| Tada . . .        | 5.35 Inches.            | Kolar . . .      | 3.96 Inches.            |
| Madanapalle . . . | 4.70 "                  | Tumkur . . .     | 5.41 "                  |
| Chandragiri . . . | 5.10 "                  | Chitaldrug . . . | 3.90 "                  |
| Hosur . . .       | 3.60 "                  |                  |                         |

From the 12th to the 22nd was almost rainless. A few local showers fell, but they were of little or no importance. The second storm crossed the coast of the Circars on the 23rd, and gave a brief but heavy burst of rainfall to the districts of the Northern Circars and Ganjam on the 23rd, 24th and 25th. The following are the reported total falls during the storm exceeding four inches :—

|                     | Inches. |                  | Inches. |
|---------------------|---------|------------------|---------|
| Vizianagram . . . . | 8.20    | Gopalpur . . . . | 6.16    |
| Vizagapatam . . . . | 6.50    | Ganjam . . . .   | 4.90    |
| Bimlipatam . . . .  | 6.35    |                  |         |

Occasional light showers fell during the remainder of the month in Southern India.

The rainfall of the month was very unequally distributed in Madras. There was a large local excess in the districts of Ganjam and the Circars or to the north of Cocanada. The excess was greatest at Vizianagram (9.1 inches). It was 7.58 inches at Vizagapatam, 6.21 inches at Bimlipatam, and 4.83 inches at Ganjam. But over the remainder of the Madras Presidency there was a considerable and general deficiency, which varied very largely in amount. In the Madura, Tinnevely, Salem, Madras and Arcot districts it averaged 3 inches. It was 9.51 inches at Saidapet, 6.17 inches at Nellore, 4.3 inches at Conjeveram, and decreased rapidly in amount into the interior, but less rapidly proportionately. There was a very slight excess in the Bellary district. In Mysore and Coorg the rainfall was  $1\frac{1}{2}$  inches above the normal.

In Burma frequent showers fell until the 11th, when rain ceased to fall. The variations were irregular, but on the whole slightly more than the normal amount was received.

In Ceylon the deficiency was even more marked than in Southern India. At Colombo, it amounted to 6.26 inches, at Kandy to 4.9 inches, at Galle to 2.84 inches, and at Trincomalee to 1.39 inches.

The following table summarizes the chief features of the rainfall of the month :—

| DISTRICTS.                                 | Normal average rainfall of month. | Actual average in 1886. | Excess or defect in inches. | Excess or defect expressed as a percentage. |

*December.*—The chief feature in the meteorology of the month was the formation of a small storm to the west of the Nicobars. It broke up as a cyclonic disturbance shortly after crossing the Madras coast. Its disintegration was, as is not unfrequently the case after cyclonic storms in India, attended by general slight disturbance throughout Central and Northern India. The subsequent general disturbance gave 72 hours' rainfall to the Central Provinces on the 10th, 11th and 12th, 48 hours' rain to Central India on the 10th and 11th, to the North-Western Provinces on the 11th and 12th, and to Bengal and Assam on the 12th and 13th.

In the Punjab the general suspension of rainfall which commenced on the 8th of October lasted until the 22nd of December, when the skies clouded over. Showers occurred somewhat irregularly from that day to the 27th in the plains and to the 29th in the hills, in all districts except Hissar, Sirsa and Gurgaon. The average fall in the plains was however less than half an inch, and the rainfall was in defect except in one or two of the more northerly districts, including Rawalpindi, Jhelum, Gurdaspur and Julundur.

Rajputana was rainless throughout the month.

Central India received some heavy showers on the 10th and 11th, and the total amount received was in excess of the average.

In the North-Western Provinces, showers in some cases unusually heavy fell on the 11th and 12th in the eastern and central districts. Banda received 2'45 inches on the 11th, Lalitpur 2'34 inches, and Allahabad 2'15 inches. In the hill districts rain or snow fell during the period of disturbance which gave showers in the Punjab, *viz.*, from the 23rd to the 27th. The rainfall of the month was below the normal in the western districts and Oudh, but was above the average in the central and eastern districts, the excess varying from '3 inch in the Jhansi district to 2 inches in the Allahabad, Banda and Lalitpur districts.

Bengal and Assam obtained a few light showers on the 12th and 13th, but not sufficient to give a total equal to the ordinary small rainfall of the month, except at one

or two stations in South Orissa, which received moderate rain on the breaking up of the Madras storm.

Some exceptionally heavy showers were received in the north and north-west districts of the Central Provinces on the 10th, 11th and 12th, and light showers in the other districts. At Khandwa 3·77 inches were registered on the 11th and at Saugor 2·91 inches. The total rainfall of the month was considerably in excess in the area of heavy rainfall on the 11th, but elsewhere it was below it by one to three-tenths of an inch.

In Hyderabad moderate showers fell during and after the dispersion of the Madras storm, or from the 10th to the 13th, but the total amounts were slightly less than the average rainfall.

Burma was practically rainless throughout the month. Frequent heavy showers fell at Nancowry between the 2nd and the 9th, and at Port Blair from the 6th to the 9th, during the formation and existence of the Madras storm.

In Madras there were frequent showers in all the districts south of Nellore and Ongole (with the exception of Cochin and Travancore) from the 1st to the 5th or 6th. The 7th and 8th were rainless, but the storm which formed on the 6th to the west of the Nicobars, and advanced across the south of the Bay on the 7th and 8th, gave a moderate supply of rain to the whole Presidency with the exception of the Madura and Tinnevely districts. The largest amounts were recorded on the Ganjam coast at a very considerable distance from the centre. The only falls exceeding two inches registered during the storm in Madras were—Ganjam 2·7 inches and Aska 2·8 inches on the 9th, and Gopalpur 3·85 inches on the 10th. The rainfall of the month was below the average in all districts except the coast districts of Ganjam and the Circars. The deficiency was largest on the Coromandel coast at Negapatam (5·92 inches), and over the Madura, Tanjore, Trichinopoly, Madras and Arcot districts in which it ranged between 2 and 3 inches.

In Bombay, no rain fell in Sind, Guzerat and the Konkan. The coast districts and the Deccan districts from Dhulia and Nasik southwards received rain during and after the breaking up of the cyclonic storm of the month and some very heavy local rainfalls were registered. 6·23 inches were recorded at Ahmednagar on the 12th and 3·84 inches at Sholapur. Over these districts the rainfall of the month was hence in excess by very variable amounts, greatest at Ahmednagar (+7·04 inches) and Sholapur (+3·65 inches). The following table shews the general distribution of the rainfall of the month:—

| DISTRICTS.                                 | Normal<br>average rain-<br>fall of month. | Actual<br>average in<br>1886. | Excess or<br>defect in<br>inches. | Excess or defect<br>expressed<br>as a<br>percentage. |

The rainfall of the year 1886 was characterized by several very striking features. The cold-weather rains from January to April were above their usual amount in the Punjab, the North-Western Provinces and Oudh, but they were more fitful than is generally the case. They were slightly more abundant than usual in January, but February was an abnormally dry month in the plains and a mild and warm one in the hills. March was opposite in character to February. The weather was harsh and cold in the hills and much snow fell, more especially in the Northern Himalayas, and more frequent and larger amounts of rain fell in Upper India than is generally the case. Opposite conditions again prevailed in April, and the weather was dry and hotter than usual. Hence, although slightly more than the normal amount of rain was received in Upper India during the pre-monsoon period, the alternations of dry and damp showery weather were of long period and sharply marked.

During the same period the cold-weather rains were steadily lighter than usual in Behar, Assam, the Central Provinces, and Berars, and the season was unusually dry. Bengal received some heavy thunder showers in March, which more than compensated for the deficient rainfall in January, February and April, but in that province the chief features of the cold-weather were undoubtedly unusual dryness of the air and the absence of cold-weather storms.

The rainfall in Southern and Western India (*i.e.*, Bombay, Madras, Mysore and Hyderabad) is always small in amount during this period of the year. But in these provinces the rainfall was smaller in amount than usual, and steadily below the average during each month.

Hence the period January to April was drier than usual throughout the whole period in every part of India except the Punjab and North-Western Provinces. In these latter districts the normal amount was received, but it fell more fitfully and less regularly than usual, two very dry months alternating with two slightly damper months than usual.

May is eminently a month of transition. It is the month of greatest solar action on the lower atmosphere in India. It generally initiates that gradual change over the equatorial belt which accompanies the establishment of continuous decreasing barometric pressure or baric gradients from the southern limits of the south-east trades to Northern India, and which is followed by that massive change known as the setting in of the south-west monsoon. May 1886 was marked by more rapid increase of temperature than usual in the interior of India, and the absolutely highest temperatures of the year were recorded in Central Rajputana on the 25th of May—a fortnight or three weeks earlier than usual. Also the maximum temperature of the year at this date in Upper India was slightly greater than has occurred for years (probably since 1875, if the records may be relied upon for this point). This larger heating action caused, so far as can be judged, a more rapid interchange of air between the heated interior and the sea area in the immediate neighbourhood. This interchange is frequently accompanied with much local disturbance, especially in the districts of Bengal and Orissa, near the head of the Bay, and to a less extent in Behar and the interior. These disturbances manifest themselves chiefly as thunderstorms or duststorms. As might be expected, they were unusually numerous in May 1886, and the rainfall of the month was large, and considerably above the average over nearly the whole of Bengal and Orissa, and to a less extent in the North-Western Provinces, Oudh and the Central Provinces. The month was however drier than usual in the Punjab, Rajputana and Central India. The rainfall of May in Western and Southern India was also above the average. This was partly due to the same cause that acted in the abovementioned districts of increased rainfall in May, and partly from the earlier commencement of the south-west monsoon rain in Ceylon and the extreme south of India. That area received fairly general, moderate and continuous rainfall from the 17th of May to the end of the month, and an exceptionally heavy downpour on the 23rd, 24th, 25th and 26th.

The south-west monsoon rains were established over the whole of India before the end of the third week of June. They were ushered in over Northern India by a storm which formed near the head of the Bay in front of a violent uprush of humid winds in the Bay, and drifted to the west-north-west across North Orissa, Chutia Nagpur, Bundelkund, and the eastern districts of Rajputana into the Punjab, where it finally disappeared, and broke up after an existence of at least ten days. The first general burst of strong winds and heavy rain along the west coast, as far north as Surat, commenced on the 10th. This influx of humid winds gave the first important rainfall of the season to the Central Provinces and Central India. During the remainder of the monsoon period the character of the rainfall, and the area of its distribution, depended mainly upon the relative strengths of the two currents. The Bombay current was strong during the latter half of June, and the whole of July. The Bengal current was somewhat more vigorous than

usual. The rainfall of the months of June and July was hence almost universally above the average in the Punjab, North-Western Provinces, Bengal, Assam, the Berars, the greater part of Rajputana and Central India, Bombay, Hyderabad, and Southern India generally. The Central Provinces was the only large area in which there was a general deficiency. It was not large in amount, but was conspicuous by contrast with the excessive rainfall in all other parts of India. There were also two or three areas in which the rainfall, when compared with that of neighbouring districts, was relatively excessive, they formed in fact meteorological areas of abnormal conditions, which determined an unusually large influx and condensation of aqueous vapour, and which hence had persistent heavy rainfall. The chief of these was Behar, over the whole of which the rainfall of the months of June and July was from thirty to one hundred per cent. in excess of the normal. This was not due to excessive rainfall accompanying the passage of a storm, but to more frequent and persistent rainfall than usual throughout the whole period. The second was Hyderabad, and the adjacent coast districts of the Bay of Bengal including the Circars. The rainfall in this area was proportionately to the average rainfall of the period far more largely in excess than in any other part of Southern India (*i.e.*, the peninsula).

The meteorological conditions changed considerably at the end of July. The Bombay current decreased greatly in strength, and was extremely feeble for upwards of a week, and rain practically ceased in Western India. It increased again on the 10th and 11th of August, but was comparatively weak throughout the remainder of the month. The decrease in the strength and body of the current was, as might have been expected, greatest in the northern portion, or that which crosses the Sind, Guzerat, and Bombay coasts. The Bengal current continued to blow steadily throughout August. The distribution of rainfall was the natural and evident result of these conditions. The rainfall of the month was considerably in defect throughout the whole of the Punjab, the greater part of Rajputana, Central India, the Central Provinces and the western districts of the Berars, the greater part of Bombay (more especially in the districts lying to the east of the Ghâts). It was in excess over Bengal, Behar, Assam, the North-Western Provinces, Hyderabad, and generally in the Madras Presidency. The deficiency was, on the whole, most pronounced in the Central Provinces. Also as in the previous two months, Behar, Hyderabad, and the Circars continued to receive abnormally excessive rain. The western districts of the North-Western Provinces (Bulandshahr, Budaon, Moradabad and Shajahanpur), and the hill and adjacent plains districts of North Bengal, the Garo and Khasia hills and Silchar formed two other local centres of unusually heavy precipitation during the month, but they were not permanent like the preceding two.

The conditions established in August became more pronounced in September. The Bombay current became gradually but steadily feebler, and after the first week of the month was in the northern half of its extension almost confined to the coast districts; whilst in the southern half it was much weaker than usual, and brought up smaller supplies of aqueous vapour for condensation. The Bengal current was not quite so strong as usual, but continued to blow with great steadiness. Rain hence ceased to fall in the Punjab, the western districts of Rajputana, Central India, and the Central Provinces after the 5th and 6th of September, and the remainder of the month was unusually dry and very unseasonable. The rainfall of the month was very largely in

defect in the Punjab, Rajputana, Central India, Central Provinces, the Berars, the Bombay Presidency, and to a less extent in Hyderabad, Mysore and Coorg and in Madras, and also in the western half of the North-Western Provinces. It was above the average in Bengal, Behar, Chutia Nagpur, the eastern half of the North-Western Provinces, and in the most southern districts of India (including Tinnevely, Madura, Trichinopoly and Tanjore) and Ceylon. The greater part of Behar received abnormally excessive rainfall, some stations (as for example Bhagalpur, Monghyr, Gya, &c.,) obtaining from two to four times the normal rainfall of the month. Northern Bengal formed again as in the month of August a local centre of heavy rainfall, and was in this respect only less prominent than Behar. The rainfall of the next two months was almost entirely due to the Bay of Bengal moist winds. A succession of depressions formed which moved in varying directions according to the conditions of the period. Two at least of these which were generated in October and one in November passed into the Central Provinces, and the general disturbance accompanying them gave cloud and rain over a very large portion of India, and in districts at very considerable distances from the centre of the depression. The two depressions of November have been fully described, and it is only necessary to state here that they were very deep depressions as compared with those of October, and occasioned very dangerous and stormy weather in the Bay. A smaller depression formed quite in the south of the Bay in the first week of December, which passed across the coast to the south of Madras into the Trichinopoly, Tanjore and Coimbatore districts. The effect of these storms, more especially the two of November and that of December, was to interrupt the regular flow of the north-east winds (the reverted south-west winds passed into the Bay chiefly through the eastern half of its entrance), and to discharge the rainfall mainly over and near the tracks of their centres. These considerations, it will be seen, serve to explain generally the rainfall of the months of October, November, and December. The total rainfall of the whole period was very small in amount in the Punjab, Rajputana, and North-Western Provinces, and was almost universally in defect. It was very considerably above the average in Behar and Chutia Nagpur in October, and in excess to a small extent in November and December (months of very slight rainfall in these divisions). It was below the average in all these months to a moderate amount in Bengal and Assam, but the rainfall of October was timely and well distributed. There was a large excess for the month of October in Central India, the Central Provinces, the Berars, Hyderabad, the greater part of Bombay (more especially the Deccan districts), and the northern districts of Madras, including Ganjam and the Circars. During the last two months the rainfall was below the average in all these districts excepting Ganjam and the Circars. The deficiency was, on the whole, largest, and most prejudicial in Southern India (more especially the more southern districts of Madras). The deficiency was least in Hyderabad. Amongst the more remarkable features of the rainfall of the year were hence the following, which it would be extremely desirable to explain, and to connect with the abnormal variations of the other remaining elements of meteorological investigation:—

1st.—The unusual dryness of the months January to April.

2nd.—The weakness of the Bombay current in August and September.

3rd.—The excessive rainfall in Behar during every month of the rains from June to October.

4th.—The deficient rainfall in the Central Provinces during the whole period of the Bombay monsoon.

5th.—The excessive rainfall in Hyderabad, the Circars and Ganjam.

A brief discussion on these features will be found in the concluding remarks.

TABLE XXX.—*Geographical summary of rainfall anomalies in 1886.*

On the mean of the whole area represented in the above table, there was an excess of +2'77 inches, or, excluding the Burmese Peninsula, +3'02 inches.

### SUMMARY.

The following remarks are based on an imperfect study of the Meteorology of India during the past year.

The general characteristics and uniformities of the Meteorology of India are now known with approximate exactness. They are much broader and simpler than those of regions in the temperate zone. This arises from its situation in the tropics and from its peculiar geographical features, which give it a variety of meteorological conditions and makes its meteorology an epitome of every variety of tropical meteorology. It is sufficient to point out that India is a peninsula forming part of the vast continent of Asia, and yet more or less completely isolated from the central and northern regions of Asia by the

vast wall of the Himalayas. It stretches southwards from that mountain chain to the neighbourhood of the Equator. It projects between the two large arms of the great Indian Ocean, *viz.*, the Bay of Bengal and Arabian Sea. The northern portion consists of a broad level plain little raised above the sea and watered by the large rivers that drain the Himalayan area, *viz.*, the Indus, Ganges, and Brahmaputra. The peninsula consists of a plateau fringed by mountains, with to the east and west a more or less narrow belt. As in America coast, in obedience to some general law, the higher mountain chains are on the western side, where the low coast belt is also extremely narrow.

The position of India within the tropics, its conformation and its partial isolation from the great Central Asian plateau, impress upon its meteorology certain well marked characteristic features. Some of these are enumerated in the following paragraphs:—

The first is the regularity and massiveness of the ordinary or climatic oscillations of pressure. Amongst these are—

(a.)—The annual oscillation varying very considerably in amount in different parts of India.

(b.)—The diurnal oscillation differing slightly in amount at different seasons and in different parts of India.

(c.)—A less regular oscillation which varies very considerably at different times of the year, and is due, like the two previous, mainly to temperature changes and therefore primarily to solar action. The average period of this appears to be from three to four days.

The nature and relation of the first two changes are shewn by the following data:—

| Leh . . . . .        | 11,500  | °222                 | °091                  | 2·4:1           |

These figures disclose some important facts. The first is that in the equatorial belt to the South of India, and in the upper regions at a height exceeding 2,000 feet in Ceylon, the diurnal oscillation is actually larger than the annual, and is from this point of view as well as from the shortness of its period very much more important than the annual oscillation. With increasing latitude in India, the average diurnal oscillation remains almost unchanged in amount (Galle= $\cdot 101$ , Roorkee= $\cdot 100$ ), but the annual oscillation in the plains increases rapidly northwards, and in Upper India its amplitude is seven times as great as that of the diurnal oscillation. The relations which have been shewn to hold for the plains stations also obtain in the upper strata up to a height of 7,000 feet at least. Thus in Ceylon at that elevation the diurnal oscillation is much more strongly marked than the annual oscillation; whilst in the mountain districts of Upper India the annual oscillation is (relatively to the diurnal oscillation) almost as strongly marked as in the plains below.

The temperature presents oscillations (diurnal and annual) as marked as those of the pressure; but the most important feature is the very great contrast there is between the temperature changes in Southern India and the adjacent oceanic area, and those of the whole of Central and Northern India. The following data illustrate this difference:—

|                                       | Mean annual temperature. | Lowest monthly temperature. | Highest monthly temperature. | Annual range. |
|---------------------------------------|--------------------------|-----------------------------|------------------------------|---------------|

| Kailang . . . . .          | 39·9                     | 18·3                        | 61·1                         | 42·8          |
| Leh . . . . .              | 40·0                     | 17·8                        | 61·6                         | 43·8          |

The annual range of temperature in the open sea in the latitude of Ceylon is about 3°, in South Ceylon and the Nicobars 4°, and it increases slowly over the peninsula proper, but rapidly from the sea coast to the interior in Northern India, the range in the West Punjab and North Sind being about 40° or from ten to thirteen times as much as in the open sea immediately to the south of India. There is a similar strongly marked contrast between the daily range of temperature in Northern and Southern India :—

It will be sufficient to point out some of the more remarkable features indicated by the temperature tables given above. In the first place the mean annual temperature of the whole of India, the Bay of Bengal and Arabian Sea differs very slightly, and is approximately  $80^{\circ}$ , ranging between  $78^{\circ}$  and  $82^{\circ}$ . As already pointed out, this common mean state is due to very different temperature conditions in different parts of the area. In the sea area and coast districts of Southern India, the annual range is small and the temperature is uniformly moderately high throughout the year; whilst in the interior and more especially in Upper India, the annual range is large, and averages  $40^{\circ}$  in the Indus Valley, and from  $30^{\circ}$  to  $40^{\circ}$  over the Punjab, North-Western Provinces, Rajputana and Central India, and the range of the mean temperature is hence excessive and the climate continental in its character. It should also be carefully noted that the mean temperature of the Punjab is  $25^{\circ}$  lower than that of the Equatorial seas to the south of India in the months of December and January, and is only  $15^{\circ}$  higher in the months of May and June. Hence the largest differences of temperature over what may be termed the Indian area occur during the cold weather, and not during the hot weather or immediately antecedent to the rains. The daily range of temperature also exhibits similar peculiarities. In Upper India (the Punjab, North Sind, and Rajputana) the month of November—the calmest month of the year—is that of greatest daily range of temperature, the amounts ranging between  $35^{\circ}$  and  $40^{\circ}$  in that area. In Central India, the Central Provinces, the greater part of the North-Western Provinces, and Behar, March is the month in which the daily range of temperature is greatest. It will thus be seen that in Upper India, the mean daily range of temperature is greatest in November, and is nearly as large in amount as the mean annual range in that part of India. Another interesting and important fact is that in Southern India and the adjacent seas the diurnal variation is considerably larger than the mean annual range, and hence is a more important phenomenon than the latter. Also in the month of August the daily range of temperature is almost uniform over by far the larger portion of the country, including Burma, Assam, Bengal, Bombay, the Central Provinces, Central India, and the North-Western Provinces, in which it varies from  $8^{\circ}$  to  $10^{\circ}$ . It is, for example, actually less in amount at Patna than at Calcutta. During the height of the rains the temperature conditions are remarkably uniform over the whole of Northern and Central India, and the mean temperature of the land is not more than  $5^{\circ}$  higher than that of the adjacent seas. Hence, from whatever point the temperature conditions of India and the adjacent seas be viewed, it is clear that the sharpest and most marked contrasts do not occur immediately antecedent to the rains, and therefore the change of the monsoons in the latter half of May and beginning of June is not a phenomenon due entirely or mainly to the special temperature conditions of India, and still less of Thibet, but to more general atmospheric changes and conditions. In other words, it is an imperfect view to consider Northern India as a furnace in May and June, and the monsoon as an indraught with Upper India as its goal or centre of aspiration.

The humidity conditions vary within very wide limits, but this is due in part to the very different temperature relations at different seasons and in different portions of the country. Humidities of 3, 4, and 5 are by no means uncommon in the Punjab, North-West Provinces, Rajputana and Sind in the months of April, May and June.

The amount of vapour is a more important element from a purely meteorological and scientific point of view than the humidity, which merely expresses a relation between the amount of vapour in the air and the temperature. The amount or weight per unit volume

of aqueous vapour in the air is, roughly speaking, proportional to the pressure, or, as it is sometimes incorrectly termed, the tension of the aqueous vapour present in the atmosphere. The following table gives a brief statement of the humidity and aqueous vapour pressure in a few cases:—

## A.—HUMIDITY.

|                      | January. | April. | June. | August. |
|----------------------|----------|--------|-------|---------|
| Leh . . . . .        | 63       | 43     | 38    | 48      |
| Lahore . . . . .     | 61       | 37     | 37    | 62      |
| Chakrata . . . . .   | 63       | 45     | 66    | 91      |
| Roorkee . . . . .    | 65       | 34     | 51    | 76      |
| Darjeeling . . . . . | 79       | 74     | 95    | 94      |
| Dhubri . . . . .     | 76       | 67     | 86    | 86      |
| Murree . . . . .     | 57       | 51     | 47    | 81      |
| Rawalpindi . . . . . | 72       | 57     | 49    | 72      |
| Quetta . . . . .     | 66       | 51     | 42    | 44      |

## B.—AQUEOUS VAPOUR PRESSURE.

|                      | NORTH-EAST MONSOON. |        | SOUTH-WEST MONSOON. |         |
|----------------------|---------------------|--------|---------------------|---------|
|                      | January.            | April. | June.               | August. |
| Leh . . . . .        | ·07                 | ·10    | ·18                 | ·26     |
| Lahore . . . . .     | ·27                 | ·38    | ·61                 | ·85     |
| Chakrata . . . . .   | ·16                 | ·22    | ·41                 | ·54     |
| Roorkee . . . . .    | ·28                 | ·32    | ·64                 | ·85     |
| Murree . . . . .     | ·14                 | ·24    | ·37                 | ·55     |
| Rawalpindi . . . . . | ·25                 | ·42    | ·63                 | ·81     |
| Quetta . . . . .     | ·16                 | ·25    | ·38                 | ·38     |
| Jacobabad . . . . .  | ·22                 | ·41    | ·68                 | ·82     |
| Darjeeling . . . . . | ·20                 | ·31    | ·49                 | ·51     |
| Dhubri . . . . .     | ·42                 | ·65    | ·90                 | ·93     |

The above shows that the amount of vapour present is from two to three or four times as much in the height of the south-west monsoon as in January during the north-east monsoon.

The chief feature, however, is the almost exact proportionality that subsists between the aqueous vapour pressure throughout nearly the whole of the period (or practically the whole year) at both the hill and plain stations. The proportionality is more exact during the north-east monsoon period than in the rains, as might indeed be expected. This proportionality, it should be noticed, extends over Beluchistan and Thibet, as well as the whole of Northern India in the plains, and to an elevation of at least 8,000 feet. It appears hence to indicate that the amount of moisture is determined over Northern India and adjacent districts by general rather than by local conditions, and that the interchange

between the lower and higher regions of the atmosphere takes place in the dry weather of the north-east monsoon more rapidly than might have been anticipated. Another point deserving notice is that the same aqueous vapour relations obtain at Leh as in Northern India, and the hill stations of Upper India, thus indicating that the southern portions of Thibet at least are not isolated meteorologically from India to the extent that has sometimes been assumed. This inference, if correct, appears to be important, more especially in connection with the north-east monsoon circulation.

Another and by far the most striking feature in Indian Meteorology is the contrast between the rainfall in different districts and also between the rainfall at different seasons in the same district.

The following give some examples of the first feature :—

| STATIONS,            | Annual Rainfall, | STATIONS,          | Annual Rainfall, |
|----------------------|------------------|--------------------|------------------|
| Cherra Poonjee . . . | 474'00 Inches.   | Leh . . . . .      | 2'56 Inches.     |
| Mohableshtar . . .   | 261'34 "         | Jacobabad . . . .  | 4'43 "           |
| Baura . . . . .      | 252'26 "         | Shikarpur . . . .  | 4'76 "           |
| Baxa . . . . .       | 216'49 "         | Rohri . . . . .    | 5'29 "           |

| Sandoway . . . . .   | 213'22 "         | Sehwan . . . . .   | 6'83 "           |
| Tavoy . . . . .      | 196'44 "         | Kurrachee . . . .  | 7'44 "           |
| Akyab . . . . .      | 195'49 "         | Jeysulmere . . . . | 7'54 "           |

The second feature is shewn by the following cases :—

| STATIONS,                | Greatest average monthly rainfall, | Least average monthly rainfall, |
|--------------------------|------------------------------------|---------------------------------|
| Cherra Poonjee . . . . . | 120'53 Inches.                     | 0'31 Inches.                    |
| Matheran . . . . .       | 84'36 "                            | 0'01 "                          |
| Baura . . . . .          | 88'40 "                            | 0'01 "                          |
| Sandoway . . . . .       | 60'34 "                            | 0'06 "                          |
| Tavoy . . . . .          | 45'98 "                            | 0'14 "                          |
| Akyab . . . . .          | 51'55 "                            | 0'14 "                          |
| Baxa . . . . .           | 48'71 "                            | 0'50 "                          |
| Bombay . . . . .         | 24'67 "                            | Nil.                            |

The most important feature in the Meteorology of India is the air circulation. Amidst considerable complexity, there stands out the broad fact that two air circulations of opposite characters prevail in India alternately. The first of these is the north-east monsoon, which usually lasts from October or November to April; and the other, the south-west monsoon circulation, prevailing from May to September or October. The normal or regular features are most strongly shewn in the Arabian Sea and to a less extent in the Bay of Bengal.

The north-east monsoon circulation is fully established some weeks earlier in the Arabian Sea than in the Bay of Bengal, and is also stronger, steadier, and more per-

sistent. It is usually fully established over the Arabian Sea by the 15th or 30th of October, whereas it does not generally set in steadily over the Bay until the beginning of December. Some of the consequences of this will be pointed out further on. The north-east monsoon circulation gives at sea steady and moderate north-east winds. In India the winds are feeble, and the direction of the surface air motion is very largely modified and determined by the shape and direction of the river valleys, mountains, and other geographical features. This lower air motion is only part of a general air circulation which includes an ascending and a descending current and an upper return current. The ascensional movement undoubtedly occurs over the equatorial region to the south of India and at the northern limit of the south-east trades in these months.

Little is known as to the area over which the descensional movement takes place. The existence of the upper return (south-west) current is established by the occasional upper cloud movements that are visible in Northern India at this time. There are various reasons for believing that the upper return current advances north as far as the Himalayas, and that the greater part of the descensional movement takes place to the north of these mountains, or over the great central plateau of Asia. Some of these are given in the following paragraphs.

The first argument is based on the differences of temperature between the hills and plains in Upper India.

The following gives the chief data :—

| MONTH.            | AVERAGE TEMPERATURE. |         | Diff. | AVERAGE TEMPERATURE. |          | Diff. |
|-------------------|----------------------|---------|-------|----------------------|----------|-------|
|                   | Simla.               | Lahore. |       | Chakrata.            | Roorkee. |       |
| January . . . . . | 40·6                 | 54·0    | 13·4  | 42·3                 | 56·4     | 14·1  |
| April . . . . .   | 58·4                 | 80·9    | 22·5  | 59·9                 | 81·8     | 21·9  |
| June . . . . .    | 67·1                 | 93·3    | 26·2  | 67·3                 | 90·2     | 22·9  |
| August . . . . .  | 62·9                 | 87·8    | 24·9  | 64·1                 | 83·7     | 19·6  |

| MONTH.            | AVERAGE TEMPERATURE. |           | Diff. | AVERAGE TEMPERATURE. |             | Diff. |
|-------------------|----------------------|-----------|-------|----------------------|-------------|-------|
|                   | Ranikhet.            | Bareilly. |       | Murree.              | Rawalpindi. |       |
| January . . . . . | 46·1                 | 57·5      | 11·4  | 38·8                 | 48·7        | 9·9   |

| June . . . . .    | 70·6                 | 89·0      | 18·4  | 71·3                 | 88·7        | 17·4  |
| August . . . . .  | 67·1                 | 83·2      | 16·1  | 66·5                 | 83·8        | 17·3  |

| MONTH.            | AVERAGE TEMPERATURE. |            | Diff. | AVERAGE TEMPERATURE. |         | Diff. |
|-------------------|----------------------|------------|-------|----------------------|---------|-------|
|                   | Quetta.              | Jacobabad. |       | Darjeeling.          | Dhubri. |       |
| January . . . . . | 39·9                 | 57·5       | 17·6  | 39·5                 | 63·0    | 23·5  |
| April . . . . .   | 57·6                 | 83·0       | 25·4  | 53·7                 | 79·0    | 25·3  |
| June . . . . .    | 73·8                 | 96·1       | 22·3  | 59·6                 | 80·4    | 20·8  |
| August . . . . .  | 75·0                 | 90·7       | 15·5  | 60·7                 | 81·1    | 20·4  |

These figures harmonize and establish very clearly that the least difference of temperature between the plains and hills in Upper India occurs in January in the midst of the cold weather, and the greatest difference in June, when the south-west monsoon has been completely established over India. In other words, up to the middle or end of June the air at the level of the plains is heated more rapidly than it is at a height of 6,000 feet and upwards, or, as has been already indicated, if the origin of the south-west monsoon is to be sought for in rapidly increasing temperature, its seat is not on the higher levels of the atmosphere or in the mountain plateaus to the north of India, but in the plains of Northern India.

The following will show that there is no such marked contrast between the temperature at the elevation of the hills in Southern India and the adjacent plains :—

| MONTH.            | AVERAGE TEMPERATURE. |              |       |             |              |       |               |        |       |
|-------------------|----------------------|--------------|-------|-------------|--------------|-------|---------------|--------|-------|
|                   | Pachmarhi.           | Hoshangabad. | Diff. | Wellington. | Colombatore. | Diff. | Newera Eliya. | Galle. | Diff. |
| January . . . . . | 57.9                 | 65.8         | 7.9   | 55.2        | 73.6         | 18.4  | 57.4          | 78.1   | 20.7  |
| April . . . . .   | 79.3                 | 87.7         | 8.4   | 65.2        | 83.3         | 18.1  | 60.0          | 82.0   | 22.0  |
| June . . . . .    | 77.6                 | 87.1         | 9.5   | 63.4        | 78.0         | 14.6  | 59.3          | 80.7   | 21.4  |
| August . . . . .  | 69.8                 | 78.4         | 8.6   | 62.4        | 76.9         | 14.5  | 58.8          | 80.1   | 21.3  |

A second argument is based on the peculiar distribution of the rainfall in the Himalayan area :—

| MONTH.              | Leh,<br>11,503 ft. | Kilba,<br>10,000 ft. | Kailang,<br>10,087 ft. | Simla.  | Darjeeling. | Cherra<br>Poonjee. | Pachmarhi. | Matheran. | Wellington. | Newera<br>Eliya. |
|---------------------|--------------------|----------------------|------------------------|---------|-------------|--------------------|------------|-----------|-------------|------------------|

| May . . . . .       | 0.1                | 5.3                  | 1.7                    | 4.7     | 7.2         | 50.0               | 0.7        | 0.8       | 4.1         | 8.2              |
| June . . . . .      | 0.2                | 2.7                  | 1.2                    | 7.9     | 24.8        | 110.0              | 10.8       | 35.7      | 3.6         | 14.4             |
| July . . . . .      | 0.5                | 5.2                  | 0.9                    | 19.3    | 30.1        | 120.5              | 28.8       | 84.4      | 3.2         | 13.7             |
| August . . . . .    | 0.4                | 4.1                  | 0.9                    | 18.1    | 26.5        | 78.9               | 18.2       | 50.7      | 4.0         | 9.4              |
| September . . . . . | 0.1                | 5.4                  | 0.7                    | 6.0     | 17.8        | 57.1               | 15.1       | 31.0      | 4.7         | 8.9              |
| October . . . . .   | 0.4                | 1.2                  | 0.4                    | 1.4     | 6.4         | 13.6               | 1.9        | 5.3       | 9.8         | 1.05             |
| November . . . . .  | 0                  | 3.8                  | 0.7                    | 0.3     | 0.2         | 1.8                | 0.4        | 0.6       | 8.5         | 9.2              |
| December . . . . .  | 0.1                | 2.0                  | 0.6                    | 1.1     | 0.2         | 0.3                | 0.7        | 0.1       | 4.1         | 7.9              |

The preceding shews that up to heights of 7,000 or 8,000 feet the rainfall in India is mainly due to the lower current of the south-west monsoon circulation. This is as true of the Sahaydri Mountains or West Ghâts, the Garo and Khasi Hills, and the Vindhya Mountain, as it is of the southern slopes of the Himalayas. But in the Western Himalayas, at

heights of 10,000 feet and upwards, the chief rainfall occurs during the north-east monsoon circulation and not during the "rains proper."

The following shews the contrast in a simpler and more striking form:—

| DISTRICTS.                 | STATIONS.            | Elevation. | (a)<br>Total average<br>rainfall, November<br>to March. | (b)<br>Total average<br>rainfall, May to<br>September. | Ratio,<br>a : b. |

The rainfall in the interior and higher Himalayan districts is hence opposite in character, distribution, and occurrence to that of the lower hills and plains. It is heaviest during the cold weather and comparatively light during the rains. The rainfall at this time increases in amount with elevation from the plains up to height of 10,000 feet certainly, and probably, up to 15,000 or 20,000 feet. The probability of this last statement can only be inferred from the rough snowfall data which have been collected during recent years, and also from the amount of precipitation necessary to supply the loss of snow by melting and evaporation. In Upper India, at the elevation of the snows the action of the sun is very powerful, and it is almost certain that the average amount of snow melted daily would be at least equivalent to a depth of  $\frac{1}{3}$  inch of water (taking a very low estimate) and is probably considerably more,—it may be from two to five times as great.

Taking the moderate estimate of  $\frac{1}{3}$  inch, the snowfall necessary to supply the loss of evaporation would be equivalent to a rainfall of about fifteen inches per annum. In the Western Himalayas there is no doubt that the snowfall occurs almost entirely during the winter months. Hence an amount of snow at least equivalent to 15 inches of rain must fall during the period October to April over the higher elevations of the Western Himalayan area (I may add that an estimate of the amount of water discharged by the great Himalayan

rivers in the months of April or May), which is almost entirely due to the melting of the Himalayan snows by the action of the sun also appears to me to establish that the estimate is certainly considerably under the mark.

The fact that the winter rainfall is much larger on the southern higher slopes and elevations of the Himalayas than in the northern, and that it diminishes rapidly with decrease of elevation and is comparatively small in amount at the level of the plains, is an almost conclusive proof that the upper return (S.-W.) current advances as far north as the Himalayas, and passes in part, if not entirely, to the north across them. According to this view the higher Himalayas play nearly the same part with respect to the upper humid S.-W. current of the north-east monsoon circulation that the West Ghâts do to the low humid south-west current of the south-west monsoon circulation. This is confirmed by the peculiar temperature relations that hold between the plains of Upper India and the adjacent hills, the comparatively damp upper current preventing to a considerable extent the reduction of temperature which goes on so rapidly in the plains in November, December, and January, and by the fact that the cloud amount in the hills in Upper India is in the cold weather nearly twice as great as at the adjacent plain stations.

One or two additional general reasons may be given in support of this view of the north-east monsoon upper return current. The charts drawn up by Mr. Dallas shewing the meteorological features of the Arabian Sea and Bay of Bengal establish most conclusively what might have been anticipated from previous knowledge, *viz.*, that the lower current of the north-east monsoon circulation in the Arabian Sea is established at an earlier date and is throughout stronger and steadier than the corresponding current in the Bay of Bengal. The upper current is the necessary complement of the lower, and will hence be distinguished by the same features of greater strength and steadiness and longer duration. Hence a sufficient reason for the fact that the upper current may advance further north in the western than the eastern Himalayas, that it may give larger supplies of rain and snow, and that its various features will be more strongly pronounced in the Punjab and North-West Provinces than in Assam and Bengal. This is well known to be the case. Also if the south-west monsoon terminates earlier than usual, it would be reasonable to expect that the north-east monsoon circulation would be established earlier than usual and be stronger and steadier and more pronounced, and hence that the accompanying rainfall, as a rule, would be in excess. In other words a weak and deficient south-west monsoon rainfall in Upper India would generally (not invariably) be followed by larger cold weather rainfall in Upper India and heavier snowfall in the adjacent Himalayan districts. This has been shewn by Mr. Hill in a paper in the Meteorological Memoirs to be the case. The occurrence of rainfall is somewhat capricious, and hence it would be naturally expected that the rule that deficient rainfall in the south-west monsoon is followed by increased rain and snow in the succeeding cold weather should not be invariable. It appears therefore to be almost certain from the preceding and other reasons that the upper or return current of the north-east monsoon circulation is a south-westerly humid current and that it advances across the Himalayas, and hence it follows that a large part, if not the whole, of the descensional movement of the north-east monsoon circulation takes place to the north of the Himalayas in Central Asia.

An important consequence follows from this view. The general experience in India is that cyclonic disturbances on the large scale in the Bay of Bengal and Arabian Sea

are of frequent occurrence in the lower humid south-west current of the south-west monsoon circulation, and rarely, if ever, occur in the drier low current of the north-east monsoon current. Local evaporation is ineffective in the seas adjacent to India to produce large cyclonic storms, and hence probably in the land area. Hence a very strong reason for believing that the origin and seat of the cyclonic disturbances of the cold weather is not primarily in the lower surface drift, but in the upper south-west humid current. It is notorious that the greater part of the snowfall in the Himalayas occurs during disturbed stormy weather in Upper India and when the wind and pressure relations shew that cyclonic conditions of a feeble and somewhat irregular character are established and that the stormy weather is more pronounced in the hills and is generally of longer duration than it is in the plains. It is not necessary to enter in full detail into the characteristics of these storms. It is sufficient to indicate that they are almost certainly due in the first instance to disturbances in the upper humid current, and that the change of winds over the plains is a subsidiary and secondary phenomenon.

There are many important features in connection with these storms which require careful consideration, and some of which do not seem explicable except on the supposition of much more complicated relations and actions than those contemplated in the previous paragraphs. But the conditions, circumstances, &c., of the winter or cold weather rainfall appear to be of great importance and deserving of special study, as suppositions have been put forward which appear not to go to the root of the matter at all, but which make the whole depend on some adventitious circumstances that are left unexplained.

The character of the south-west monsoon of 1886 as shewn by the rainfall is given in the following extract from Mr. Blanford's Annual Report for 1885:—

"The rains set in on the west of Travancore on the 6th June, with the formation of a small cyclonic storm over the south of the peninsula; but they did not reach further north than Ratnagiri, and when this storm broke up, there was no further heavy rain on the northern half of the west coast, till the end of the month; and in the Northern Konkan till the middle of July. Even then, the rains did not continue steadily. No further heavy rain fell at Bombay till the middle of August, and throughout the season the rains were light and interrupted in Western India.

"In Bengal, on the other hand, the rains set in about the usual date, in the middle of June, and speedily penetrated to the North-Western Provinces and the Punjab. In the Central Provinces they set in at the same time as in Bengal. July was a month of light rainfall in the Punjab, and in Rajputana and Western India generally, during the first fortnight or three weeks, as well as in the Gangetic plain. In the Central Provinces, parts of Bengal and Assam, the fall was more normal. August was a very wet month in the Punjab and over the greater part of the North-Western and Western India, owing to the passage of a series of cyclonic storms, of the usual monsoon type, with comparatively light wind, but locally heavy rain. But Northern Bengal and Assam were prejudicially affected by these storms, the rain-bearing current being drawn aside from these provinces towards the vortex of the storms. In Madras there had been more than the usual amount of rain in June; but in the subsequent months, it was chiefly restricted to the northern districts of the presidency; and, in the Carnatic, the showers were even less copious and frequent than usual."

The preceding remarks shew that the south-west monsoon rainfall of 1885 was approximately normal and did not present any marked deviation from the normal. The rainfall was deficient in Sind, Guzerat, and some parts of Bombay, and the current retreated slightly earlier than usual. It will thus be seen that this would probably be followed by a slightly stronger north-east monsoon circulation than usual, more especially over the Arabian Sea, and hence that the winter rains in Northern India and the snowfall in the Himalayan range would be probably normal or slightly in excess, and that these features would be some-

what more marked in the western than the eastern Himalayas. These, as has already been seen in the remarks on the rainfall of the months January to March, were the chief features of the cold weather rains of 1885-86.

The air circulation which obtains over the whole of India from the beginning of June to the middle or end of September, or the south-west monsoon, is of the very greatest importance from an economic point of view, as it is the circulation which brings up nine-tenths of the rainfall of the country. If the continent of Asia did not exist and the Indian Ocean stretched northwards to the Arctic regions as the Pacific Ocean does, north-east winds would be the permanent features of the area now occupied by India. Hence the south-west monsoon circulation is an abnormal feature, a yearly recurring anomaly caused and produced by the presence and position of the great Asiatic continent. What may be termed the furnace theory is still very largely adopted. According to this theory the land area of India or Central Asia becomes intensely heated in May, June and July, and gives rise to an indraught from neighbouring regions, one of which is the sea area to the south. Hence originate the southerly winds of the south-west monsoon which by a well-known law become converted to south-west winds as they advance northwards from the Equator. According to some Meteorologists, Northern or Upper India is the furnace or "centre of aspiration"; according to others, the Central Asian plateau. The causes of the initiation and maintenance of the south-west monsoon are apparently much more complex than this, and the furnace theory is a very imperfect representation.

The following table gives the mean temperature of three stations; one, Lahore, in the open Punjab plains, at an elevation of 700 feet; a second, Simla, lying on the crest of a hill, 7,000 feet high, on the third range of elevations from the plains, and nearly midway between the plains and first line of snows; and Leh, in the open valley of the Indus, at an elevation of 11,500 feet, but bounded to the north and south by snowy ranges:—

*Mean monthly temperature.*

|                                               | January. | February. | March. | April. | May. | June. |
|-----------------------------------------------|----------|-----------|--------|--------|------|-------|
|                                               | 0        | 0         | 0      | 0      | 0    | 0     |
| Lahore . . . . .                              | 54°0     | 58°5      | 69°4   | 80°9   | 88°2 | 93°3  |
| Simla . . . . .                               | 40°6     | 41°1      | 49°5   | 58°4   | 63°4 | 67°1  |
| Leh . . . . .                                 | 17°8     | 19°3      | 31°0   | 40°8   | 47°1 | 56°0  |
| Difference between Lahore and Simla . . . . . | 13°4     | 17°4      | 19°9   | 22°5   | 24°8 | 26°2  |
| Difference between Lahore and Leh             | 36°2     | 39°2      | 38°4   | 40°1   | 41°1 | 37°3  |

The mean annual difference of temperature between Lahore and Simla is 20°4'. These figures hence shew that at the elevation of Simla the difference of temperature is less than the mean annual difference (which may be assumed to be approximately that due to the difference of elevation) in the months of January, February and March, but that in the hot weather months that precede and initiate the south-west monsoon the difference of temperature is above the normal and steadily increases until June.

The mean annual difference of temperature for Lahore and Leh is 35°2'. Hence the difference is above the average from January to June and steadily increases until June, and

it is not less than the average until the month of July. Consequently the plains of Upper India in April, May, June and July are relatively hotter than the Himalayas or the Thibetan plateau, but during the latter months of the south monsoon, *viz.*, the latter half of July, August and September, Upper India is comparatively cool, and temperature in Thibet in-excessive compared with it. Hence if the south-west monsoon be primarily due to excessive heating of the land surface air and to relatively high temperature, the seat of this must be the lower atmospheric strata in Upper India at the commencement of the monsoon, and after they set in (in July, August and September), the hot area must be in the Central Asian plateau in the higher atmospheric strata. The latter is not the case, for, as shown by the rainfall, the ascensional movement and therefore the centre of aspiration is over Northern and Central India.

The character of the establishment of the south-west monsoon is also opposed to this theory. Usually about the end of May or beginning of June a rapid change takes place in the weather over the whole of India. It commences in the south of India and extends northwards. A strong advance of humid winds occurs in the south of the Bay and in Southern India extending from the equatorial regions. It accompanies a large amount of atmospheric disturbance which frequently concentrates into a cyclonic storm and always carries northwards with it strong winds and much rain. The first advance sometimes extends as far as the latitudes of Madras or Bombay and sometimes as far as Burma and even Aracan. It is usually followed by a lull and then by a second advance, and sometimes a third penetrating further and further north, and finally extends over the whole of India, completely changing the character of the weather in the interior.

The important feature about these sudden and more or less impulsive uprushes of this humid current is that they are evidently not due to any peculiar abnormal features lasting for a short time in Upper India just before or during their advance. They commence as local phenomena in the south and advance as if they were pressed forward. It would almost seem as if, although gradients favourable for the advance of these south-west winds may exist for some time, the statical resistances to the motion and northward extension of the south-east trades are great, and it is only after a considerable accumulation of energy that the circulation advances with an impulsive movement northwards into the comparatively calm area in front as an intruding element.

It is this peculiar character of the establishment of the monsoon which is described popularly as "the burst of the monsoon" and which appears to establish that it is a more complicated phenomenon than an indraught to an area of high temperature and low pressure in Northern India or Thibet.

The increasing heat of spring and summer in Northern India and Central Asia causes a steady fall of pressure which finally produces in April and May a reversal of the gradients previously established. Sometime after this has taken place the true south-west monsoon current advances rapidly northwards and the local circulations are displaced by, or absorbed in, the massive and general circulation of the south-west monsoon. This change modifies in the most striking manner the weather in the whole of the interior of the country.

The causes of the establishment are then more general than are frequently supposed and depend upon the larger changes of pressure over Central and Northern Asia chiefly, and not mainly on those which occur in the Indian land area. The peculiar

conditions of its advance are what might be expected when the viscosity of the air and the tendency of a massive current like the south-east trades to continue its motion unaltered after change of conditions are taken into account in combination with the slow nature of the pressure changes in Asia. It is also remarkable that the great fall of pressure in Upper India rarely if ever takes place until the monsoon current has been established over the greater part of India and appears to be an effect of the advance rather than due to the great heat of the interior either of India or Central Asia, and is a rapid phenomenon.

A study of the charts of the Bay of Bengal and Arabian Sea drawn up by Mr. Dallas shews most unmistakably that the main body of the current which sweeps over India comes from the Bombay coast, and that it is the direct continuation of the south-east trades. There is an unbroken continuity of motion from the south of the Equator to the Bombay coast, the direction of the air motion or wind changing from south-east through south to south-west and west as it advances northwards. The continuity of the motion is not quite so plainly marked in the Bay of Bengal as in the Arabian Sea. This is due to several causes. In the first place, the south-east trades are, as might naturally be expected, neither so steady nor so strong in the eastern as in the western half of the equatorial region of the Indian ocean. Again the advance of the south-west monsoon current towards the Bombay coast and the high wall of hills which rises up immediately from it, causes a deflection of a considerable portion of the current southward, and this interferes with the regular advance of the southerly current into the Bay. Mr. Dallas's charts shew that the deflected or south-west monsoon current is least steady near the east and west limits of the entrance to the Bay, *i.e.*, off the coasts of Ceylon and Sumatra, and that it is most steady in the intermediate area. There is undoubtedly a considerable amount of irregular action at and near the entrance to the Bay, but that in no way alters the main fact that in the Bay of Bengal as in the Arabian Sea the south-west monsoon current is the direct continuation of the south-east trades, and it is owing to the fact that the current brings up supplies of vapour from the large evaporating area of the North Indian Ocean as well as the Arabian Sea and Bay of Bengal that the rainfall in India during the monsoon is so large, persistent, and continuous. Consequently from this point of view the south-west monsoon circulation must be regarded as extending from the Tropic of Capricorn to the northern portions of India and Burma. The ascensional motion of this current takes place over the area of rainfall in India and Burma more or less irregularly, and the more or less oscillatory or intermittent character of the rainfall and accompanying actions in India follows naturally from these conditions. The linking on of the meteorology of India to that of China and Thibet or Central Asia remains yet to be accomplished.

It may be noted here that the action of the peninsula in breaking up the lower south-west monsoon circulation into two branches gives rise to some interesting features. A portion of the current which advances up the Bay of Bengal is deflected to the westwards up the Gangetic plain. The Bombay current flows across the peninsula in an east or east-north-east direction towards the former. There is hence an area to the south of the Gangetic plain stretching from Rajputana to Sambalpur and Hazaribagh, in which there is much interaction. That area usually forms a well marked trough or tongue of low pressure during the greater part of the rains, and there is a very marked tendency

for the smaller storms of the rains to advance along this trough. These actions give a peculiar distribution of rainfall to Northern India, the chief features of which can be seen at a glance by reference to the rainfall maps of India, which have been compiled by Mr. Blanford for his important and valuable memoir on "the Rainfall of India."

In the preceding remarks the probable general character and origin of the south-west monsoon circulation have been briefly stated. It is undoubtedly the extension of the south-east trades across the Equator over India and Burma and the adjacent seas. It is due to the prolonged general action of increasing temperature in the Asiatic continent, supplemented largely by local action in India, due to its position and its peculiar geographical relations with Central Asia. The continuation of the south-east trades across the Equator is steadiest and strongest in the equatorial regions of the Arabian Sea. It is generally weaker and much more irregular and unsteady in the equatorial regions to the south of the entrance to the Bay. The ascending movement which forms an integral portion of the circulation generally takes place irregularly over the land area of India and Burma, as is proved by the very large and almost continuous rainfall over that area during a large portion of the south-west monsoon period. In the Western Himalayas the lower humid current barely extends to the first line of snows, and it gives little or no snow to the higher mountains north of the Punjab or the North-West Provinces. In the Eastern Himalayas to the north of Assam and Bengal, on the contrary, the humid current almost certainly penetrates beyond the snows into Thibet, and gives a considerable snowfall to the mountain regions. The evidence in favour of this is not large in amount, but appears conclusively to establish that there is a considerable difference between the meteorology of the Eastern and Western Himalayan regions during the south-west monsoon.

The intermittent or oscillatory character of the south-west monsoon rainfall and air motion in Northern India has been repeatedly pointed out in various reports of the Department. During the monsoon, a strong advance of humid winds across the Bombay or Bengal coasts is followed by its rapid extension over a large part of the interior, and by heavy general rainfall for several days. The influx then diminishes in strength, rainfall decreases in amount or ceases in the interior, and light local winds set in over Upper India. This interval of comparatively fine but oppressive sultry weather is usually followed by another advance of humid winds across the coast, and a repetition of the previous phenomena or actions.

The periods of great strength of the two currents do not usually coincide, and hence it is almost certain that they are mainly due to actions and conditions in the sea area to the south and not primarily to conditions in the land area of India.

One of the most important features in the south-west monsoon circulation is the great differences which occur in the amount and distribution of the accompanying rainfall from year to year. There is on the other hand a general similarity or homogeneity of character in the distribution of rainfall during the monsoon period of any given year. This has been fully illustrated by the rainfall of the south-west monsoon period of the year 1886, and has been frequently referred to in previous annual reports. The fact that the character and distribution of the rainfall of the south-west monsoon is fairly uniform throughout the whole season suggests strongly that it is mainly dependent upon the previous meteorological conditions established over India and the adjacent seas, and that the

monsoon circulation not only does not remove previous peculiarities but rather tends to perpetuate them, and in some cases even to exaggerate or emphasize them for longer or shorter periods. That the monsoon circulation should be modified by pre-existing abnormal features or conditions, seems to be almost self-evident. That the introduction of the south-west monsoon current into India should tend to perpetuate rather than to remove the pre-existing abnormal features might be inferred from the analogous case of water motion and from the known general tendency of meteorological actions to perpetuate for some time the states or conditions which give rise to these actions rather than to remove them.

The pre-existing conditions which modify the strength and extent of the monsoon circulation and of the accompanying rainfall have been sought for in various directions. The most hopeful are—

1. The character and distribution of the snowfall of the previous winter in the Himalayan area.
2. Abnormal conditions in India, as indicated chiefly by the peculiar pressure variations or anomalies antecedent to the advent of the monsoon.
3. Abnormal conditions in the sea area to the south of India, more especially in the equatorial regions.

Little is likely to be known of the meteorology of the great plateau to the north and north-west of India for many years, and it will not be possible for years to ascertain whether these regions exercise any large influence in modifying the Meteorology of India, more especially during the south-west monsoon period.

The first method has been discussed by Mr. Blanford in his paper on the Himalayan snowfall and has already afforded valuable indications for several years. It is only necessary to point out here that it is partly included in the second, as protracted and unusually heavy snowfall or very deficient snowfall in the cold weather accompanies and occasions large variations of pressure for some time afterwards in Northern India. These are, roughly speaking, proportional in their intensity and duration to the snowfall. This theory has the merit of assigning a physical cause, but labours under the disadvantage of not being measurable except in a very rough and tentative manner (*i.e.*, chiefly the opinion of the hillsmen in a few districts under British control).

The second method of the pressure variations or anomalies has, on the other hand, the advantage that they can be determined with approximate exactness by the observations taken in India. This method is based on the assumption that the distribution of the monsoon rains is largely determined by the pre-existing pressure conditions in India. The rainfall tends to occur most abundantly over or in the neighbourhood of areas of relatively deficient pressure and to be scanty in areas of increased pressure. The extent and intensity of the effect depends as much upon the position of the area of low pressure with respect to the current or general monsoon circulation as upon its amount.

The third assumption asserts that there may be abnormal pressure and other condition over the sea area from which the current advances, and that these conditions may modify the extent and strength of the circulation in India. The marked differences between the paths of the cyclonic storms of one year and another in the Bay of Bengal indicate that there are undoubtedly abnormal conditions frequently prevalent over the sea area as well as over the land. Little can however be done in ascertaining the extent of their influence

until the more systematic collection of information from ships traversing the seas to the south of India has been initiated.

It remains to consider the south-west monsoon rainfall of 1886 and to trace the variation to one or other of their probable causes.

So far as can be judged from the reports received of the snowfall of 1885-86, the snowfall in that winter was in no way exceptional in character. The normal amount apparently fell, and during the usual period. It therefore in no way accounts for the peculiar features of the rainfall distribution.

Also the mean pressure variations for the whole of India were unusually small, and the mean pressure antecedent to and during the rains was practically normal, much more so than has been the case for many years. There were hence no general abnormal pressure conditions common to the whole of India which will explain the weakness of the two currents, and more especially of the Bombay current during the months of August and September, and the consequent deficient rainfall over the Punjab, Central India, and the Central Provinces. Hence it appears probable that the abnormal conditions occasioning this large peculiarity of the monsoon circulation were not over the land and hence over the sea area to the south.

There were, on the other hand, some small but remarkably persistent abnormal variations of pressure, which appear to be directly related to the monsoon rainfall. These were :—

*1st.*—Diminished pressure in the Peninsula, more especially in the area represented by the stations of Sholapur, Belgaum, Secunderabad, Bellary and Masulipatam.

*2nd.*—Increased pressure over the greater part of Northern India. This was most strongly shewn at certain stations situated in the area usually occupied by the trough of low pressure during the rains, or at Agra, Jhansi, Hazaribagh and Sambalpur.

A reference to the barometric section will show that these features were more or less permanent during the whole year, and that they were as strongly marked for some time before the rains as during the rains.

There was throughout the whole monsoon a steady determination of rainfall to the low pressure area of the Peninsula, so that Hyderabad, the Bombay and Madras portions of the Deccan, and the Circars received unusually abundant rainfall. The whole of that area obtained unusually heavy rain in every month from June to September.

Again the existence of this low pressure area and the high belt of pressure to the north apparently gave a more directly westerly course to the Bombay current than usual. It only penetrated across Rajputana and the Central Provinces into the Punjab and North-Western Provinces during the height of the monsoon in June and July. After the first great burst of the monsoon was over, its influence became less and less in that area, and it finally retreated much earlier than usual. Also to the north of this area of increased pressure or large positive abnormal variations or in Northern India, pressure was lowest relatively to the mean in the eastern portion or in Behar and to a less extent in Bengal; there was a slight but marked deficiency of pressure in Behar, which increased during the rains. The Bengal current hence gave steady but abundant rain over the whole of Bengal and Behar and the eastern districts of the North-West Provinces. The deter-

mination of rainfall to Behar, more especially Central and South Behar, is however hardly explicable by the *actual* variations as they are small in amount. Unfortunately these variations depend on the observations at Gya and Patna, the first of which have been more or less unsatisfactory for years, notwithstanding every effort of the department to secure accurate observations. The Observatory at Patna also worked under very unsatisfactory conditions during the year in consequence of a change of observer, and hence the pressure relations of this area at that time are very doubtful.

The low pressure in Ganjam and Circars, in common with that of the Deccan, became intensified during the latter part of the rains. It was apparently directly connected with the peculiar conditions of the first half of October and with the marked determination of a succession of storms to that area in October and November.

These remarks are sufficient to show that there was a direct relation between the pressure anomalies of the year and the local variations of rainfall, and that they do, to some extent at least, give a key to the persistent local irregularities of the rainfall distribution during the south-west monsoon.

## EXPLANATION OF THE PLATES.

---

PLATE I.—*Frontispiece*.—A chart of India, showing the positions of the meteorological observatories and rain-gauge stations in 1886.

PLATES II TO IV.—Charts showing the mean distribution of temperature and pressure, and the resultant wind directions in each month of 1886.

TEMPERATURE.—The data for the isotherms are given in Table VI of the Appendix. The isotherms (in red) represent increments of 5° Fahrenheit; and the figures, indicating their respective values, are placed on the side of the higher temperature.

PRESSURE.—The data for the isobars are given in Table VIII of the Appendix. The isobars (in blue) are given for each twentieth of an inch, and their values are marked by the figures on the side of the higher pressure.

WIND DIRECTIONS.—These are the resultants computed by Lambert's formula from the observations, an equal value being assigned to each. Their values are given in Table IX of the Appendix. The arrows show the direction of the resultant, the point of the arrows indicating the station; and by their respective lengths, the percentage of the observations expressing the numerical value of the resultant in each case; five-eighths of an inch being equal to 100 per cent.

PLATE V.—Chart showing the tracks of the storms originating in the Bay of Bengal in 1886.
